[17061] GAM1228 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1228 was detected is described hereinabove with reference to Figs. 2-8.

[17062] GAM1228 gene, herein designated GAM GENE, and GAM1228 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17063] GAM1228 gene, herein designated GAM GENE, encodes a GAM1228 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1228 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1228 precursor RNA is designated SEQ ID:1205, and is provided hereinbelow with reference to the sequence listing part.

[17064] GAM1228 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17065] An enzyme complex designated DICER COMPLEX, dices the GAM1228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1228 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1228 RNA is designated SEQ ID:3806, and is provided hereinbelow with reference to the sequence listing part.

[17066] GAM1228 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1228 target RNA, herein designated GAM TARGET RNA. GAM1228 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17067] GAM1228 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1228 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1228 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1228 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1228 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17068] The complementary binding of GAM1228 RNA, herein designated GAM RNA, to target binding sites on GAM1228 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1228 target RNA, herein designated GAM TARGET RNA, into GAM1228 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17069] It is appreciated that GAM1228 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1228 target genes. The mRNA of each one of this plurality of GAM1228 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1228 RNA, herein designated GAM RNA, and which when bound by GAM1228 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1228 target proteins.

[17070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1228 gene, herein designated GAM GENE, on one or more GAM1228 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17071] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1228 correlate with, and may be deduced from, the identity of the target genes which GAM1228 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17072] Nucleotide sequences of the GAM1228 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1228 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1228 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1228 are further described hereinbelow with reference to Table 1.

[17073] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1228 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17074] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1229 (GAM1229) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17075] GAM1229 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1229 was detected is described hereinabove with reference to Figs. 2-8.

[17076] GAM1229 gene, herein designated GAM GENE, and GAM1229 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17077] GAM1229 gene, herein designated GAM GENE, encodes a GAM1229 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1229 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1229 precursor RNA is designated SEQ ID:1206, and is provided hereinbelow with reference to the sequence listing part.

[17078] GAM1229 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17079] An enzyme complex designated DICER COMPLEX, dices the GAM1229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1229 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1229 RNA is designated SEQ ID:3808, and is provided hereinbelow with reference to the sequence listing part.

[17080] GAM1229 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1229 target RNA, herein designated GAM TARGET RNA. GAM1229 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17081] GAM1229 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1229 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1229 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1229 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1229 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17082] The complementary binding of GAM1229 RNA, herein designated GAM RNA, to target binding sites on GAM1229 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1229 target RNA, herein designated GAM TARGET RNA, into GAM1229 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17083] It is appreciated that GAM1229 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1229 target genes. The mRNA of each one of this plurality of GAM1229 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1229 RNA, herein designated GAM RNA, and which when bound by GAM1229 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1229 target proteins.

[17084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1229 gene, herein designated GAM GENE, on one or more GAM1229 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17085] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1229 correlate with, and may be deduced from, the identity of the target genes which GAM1229 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17086] Nucleotide sequences of the GAM1229 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1229 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1229 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1229 are further described hereinbelow with reference to Table 1.

[17087] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1229 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17088] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1230 (GAM1230) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17089] GAM1230 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1230 was detected is described hereinabove with reference to Figs. 2-8.

[17090] GAM1230 gene, herein designated GAM GENE, and GAM1230 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17091] GAM1230 gene, herein designated GAM GENE, encodes a GAM1230 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1230 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1230 precursor RNA is designated SEQ ID:1207, and is provided hereinbelow with reference to the sequence listing part.

[17092] GAM1230 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17093] An enzyme complex designated DICER COMPLEX, dices the GAM1230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1230 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1230 RNA is designated SEQ ID:3809, and is provided hereinbelow with reference to the sequence listing part.

[17094] GAM1230 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1230 target RNA, herein designated GAM TARGET RNA. GAM1230 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17095] GAM1230 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1230 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1230 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1230 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1230 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17096] The complementary binding of GAM1230 RNA, herein designated GAM RNA, to target binding sites on GAM1230 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1230 target RNA, herein designated GAM TARGET RNA, into GAM1230 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17097] It is appreciated that GAM1230 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1230 target genes. The

mRNA of each one of this plurality of GAM1230 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1230 RNA, herein designated GAM RNA, and which when bound by GAM1230 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1230 target proteins.

[17098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1230 gene, herein designated GAM GENE, on one or more GAM1230 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17099] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1230 correlate with, and may be deduced from, the identity of the target genes which GAM1230 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17100] Nucleotide sequences of the GAM1230 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1230 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1230 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1230 are further described hereinbelow with reference to Table 1.

[17101] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1230 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17102] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1231 (GAM1231) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17103] GAM1231 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1231 was detected is described hereinabove with reference to Figs. 2-8.

[17104] GAM1231 gene, herein designated GAM GENE, and GAM1231 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17105] GAM1231 gene, herein designated GAM GENE, encodes a GAM1231 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1231 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1231 precursor RNA is designated SEQ ID:1208, and is provided hereinbelow with reference to the sequence listing part.

[17106] GAM1231 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1231 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17107] An enzyme complex designated DICER COMPLEX, dices the GAM1231 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1231 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1231 RNA is designated SEQ ID:3810, and is provided hereinbelow with reference to the sequence listing part.

[17108] GAM1231 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1231 target RNA, herein designated GAM TARGET RNA. GAM1231 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17109] GAM1231 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1231 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1231 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1231 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1231 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17110] The complementary binding of GAM1231 RNA, herein designated GAM RNA, to target binding sites on GAM1231 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1231 target RNA, herein designated GAM TARGET RNA, into GAM1231 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17111] It is appreciated that GAM1231 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1231 target genes. The mRNA of each one of this plurality of GAM1231 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1231 RNA, herein designated GAM RNA, and which when bound by GAM1231 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1231 target proteins.

[17112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1231 gene, herein designated GAM GENE, on one or more GAM1231 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17113] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1231 correlate with, and may be deduced from, the identity of the target

genes which GAM1231 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17114] Nucleotide sequences of the GAM1231 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1231 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1231 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1231 are further described hereinbelow with reference to Table 1.

[17115] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1231 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17116] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1232 (GAM1232) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17117] GAM1232 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1232 was detected is described hereinabove with reference to Figs. 2-8.

[17118] GAM1232 gene, herein designated GAM GENE, and GAM1232 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17119] GAM1232 gene, herein designated GAM GENE, encodes a GAM1232 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1232 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1232 precursor RNA is designated SEQ ID:1209, and is provided hereinbelow with reference to the sequence listing part.

[17120] GAM1232 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17121] An enzyme complex designated DICER COMPLEX, dices the GAM1232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1232 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1232 RNA is designated SEQ ID:3811, and is provided

hereinbelow with reference to the sequence listing part.

[17122] GAM1232 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1232 target RNA, herein designated GAM TARGET RNA. GAM1232 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17123] GAM1232 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1232 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1232 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1232 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1232 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17124] The complementary binding of GAM1232 RNA, herein designated GAM RNA, to target binding sites on GAM1232 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1232 target RNA, herein designated GAM TARGET RNA, into GAM1232 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17125] It is appreciated that GAM1232 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1232 target genes. The mRNA of each one of this plurality of GAM1232 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1232 RNA, herein designated GAM RNA, and which when bound by GAM1232 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1232 target proteins.

[17126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1232 gene, herein designated GAM GENE, on one or more GAM1232 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17127] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1232 correlate with, and may be deduced from, the identity of the target genes which GAM1232 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17128] Nucleotide sequences of the GAM1232 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1232 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1232 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1232 are further described hereinbelow with reference to Table 1.

[17129] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1232 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17130] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1233 (GAM1233) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17131] GAM1233 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1233 was detected is described hereinabove with reference to Figs. 2-8.

[17132] GAM1233 gene, herein designated GAM GENE, and GAM1233 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17133] GAM1233 gene, herein designated GAM GENE, encodes a GAM1233 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1233 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1233 precursor RNA is designated SEQ ID:1210, and is provided hereinbelow with reference to the sequence listing part.

[17134] GAM1233 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17135] An enzyme complex designated DICER COMPLEX, dices the GAM1233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1233 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1233 RNA is designated SEQ ID:3812, and is provided hereinbelow with reference to the sequence listing part.

[17136] GAM1233 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1233 target RNA, herein designated GAM TARGET RNA. GAM1233 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17137] GAM1233 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1233 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1233 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1233 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1233 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17138] The complementary binding of GAM1233 RNA, herein designated GAM RNA, to target binding sites on GAM1233 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1233 target RNA, herein designated GAM TARGET RNA, into GAM1233 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17139] It is appreciated that GAM1233 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1233 target genes. The mRNA of each one of this plurality of GAM1233 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1233 RNA, herein designated GAM RNA, and which when bound by GAM1233 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1233 target proteins.

[17140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1233 gene, herein designated GAM GENE, on one or more GAM1233 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17141] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1233 correlate with, and may be deduced from, the identity of the target genes which GAM1233 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17142] Nucleotide sequences of the GAM1233 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1233 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1233 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1233 are further described hereinbelow with reference to Table 1.

[17143] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1233 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17144] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1234 (GAM1234) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17145] GAM1234 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1234 was detected is described hereinabove with reference to Figs. 2-8.

[17146] GAM1234 gene, herein designated GAM GENE, and GAM1234 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17147] GAM1234 gene, herein designated GAM GENE, encodes a GAM1234 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1234 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1234 precursor RNA is designated SEQ ID:1211, and is provided hereinbelow with reference to the sequence listing part.

[17148] GAM1234 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17149] An enzyme complex designated DICER COMPLEX, dices the GAM1234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1234 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1234 RNA is designated SEQ ID:3814, and is provided hereinbelow with reference to the sequence listing part.

[17150] GAM1234 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1234 target RNA, herein designated GAM TARGET RNA. GAM1234 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17151] GAM1234 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1234 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1234 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1234 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1234 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17152] The complementary binding of GAM1234 RNA, herein designated GAM RNA, to target binding sites on GAM1234 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1234 target RNA, herein designated GAM TARGET RNA, into GAM1234 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17153] It is appreciated that GAM1234 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1234 target genes. The mRNA of each one of this plurality of GAM1234 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1234 RNA, herein designated GAM RNA, and which when bound by GAM1234 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1234 target proteins.

[17154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1234 gene, herein designated GAM GENE, on one or more GAM1234 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17155] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1234 correlate with, and may be deduced from, the identity of the target genes which GAM1234 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17156] Nucleotide sequences of the GAM1234 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1234 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1234 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1234 are further described hereinbelow with reference to Table 1.

[17157] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1234 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17158] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1235 (GAM1235) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17159] GAM1235 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1235 was detected is described hereinabove with reference to Figs. 2-8.

[17160] GAM1235 gene, herein designated GAM GENE, and GAM1235 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17161] GAM1235 gene, herein designated GAM GENE, encodes a GAM1235 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1235 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1235 precursor RNA is designated SEQ ID:1212, and is provided hereinbelow with reference to the sequence listing part.

[17162] GAM1235 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17163] An enzyme complex designated DICER COMPLEX, dices the GAM1235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1235 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1235 RNA is designated SEQ ID:3813, and is provided hereinbelow with reference to the sequence listing part.

[17164] GAM1235 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1235 target RNA, herein designated GAM TARGET RNA. GAM1235 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17165] GAM1235 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1235 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1235 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1235 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1235 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17166] The complementary binding of GAM1235 RNA, herein designated GAM RNA, to target binding sites on GAM1235 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1235 target RNA, herein designated GAM TARGET RNA, into GAM1235 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17167] It is appreciated that GAM1235 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1235 target genes. The mRNA of each one of this plurality of GAM1235 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1235 RNA, herein designated GAM RNA, and which when bound by GAM1235 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1235 target proteins.

[17168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1235 gene, herein designated GAM GENE, on one or more GAM1235 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17169] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1235 correlate with, and may be deduced from, the identity of the target genes which GAM1235 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17170] Nucleotide sequences of the GAM1235 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1235 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1235 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1235 are further described hereinbelow with reference to Table 1.

[17171] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1235 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17172] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1236 (GAM1236) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17173] GAM1236 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1236 was detected is described hereinabove with reference to Figs. 2-8.

[17174] GAM1236 gene, herein designated GAM GENE, and GAM1236 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17175] GAM1236 gene, herein designated GAM GENE, encodes a GAM1236 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1236 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1236 precursor RNA is designated SEQ ID:1213, and is provided hereinbelow with reference to the sequence listing part.

[17176] GAM1236 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1236 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17177] An enzyme complex designated DICER COMPLEX, dices the GAM1236 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1236 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1236 RNA is designated SEQ ID:3815, and is provided hereinbelow with reference to the sequence listing part.

[17178] GAM1236 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1236 target RNA, herein designated GAM TARGET RNA. GAM1236 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17179] GAM1236 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1236 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1236 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1236 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1236 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17180] The complementary binding of GAM1236 RNA, herein designated GAM RNA, to target binding sites on GAM1236 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1236 target RNA, herein designated GAM TARGET RNA, into GAM1236 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17181] It is appreciated that GAM1236 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1236 target genes. The

mRNA of each one of this plurality of GAM1236 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1236 RNA, herein designated GAM RNA, and which when bound by GAM1236 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1236 target proteins.

[17182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1236 gene, herein designated GAM GENE, on one or more GAM1236 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17183] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1236 correlate with, and may be deduced from, the identity of the target genes which GAM1236 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17184] Nucleotide sequences of the GAM1236 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1236 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1236 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1236 are further described hereinbelow with reference to Table 1.

[17185] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1236 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17186] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1237 (GAM1237) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17187] GAM1237 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1237 was detected is described hereinabove with reference to Figs. 2-8.

[17188] GAM1237 gene, herein designated GAM GENE, and GAM1237 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17189] GAM1237 gene, herein designated GAM GENE, encodes a GAM1237 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1237 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1237 precursor RNA is designated SEQ ID:1214, and is provided hereinbelow with reference to the sequence listing part.

[17190] GAM1237 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17191] An enzyme complex designated DICER COMPLEX, dices the GAM1237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1237 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1237 RNA is designated SEQ ID:3816, and is provided hereinbelow with reference to the sequence listing part.

[17192] GAM1237 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1237 target RNA, herein designated GAM TARGET RNA. GAM1237 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17193] GAM1237 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1237 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1237 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1237 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1237 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17194] The complementary binding of GAM1237 RNA, herein designated GAM RNA, to target binding sites on GAM1237 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1237 target RNA, herein designated GAM TARGET RNA, into GAM1237 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17195] It is appreciated that GAM1237 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1237 target genes. The mRNA of each one of this plurality of GAM1237 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1237 RNA, herein designated GAM RNA, and which when bound by GAM1237 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1237 target proteins.

[17196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1237 gene, herein designated GAM GENE, on one or more GAM1237 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17197] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1237 correlate with, and may be deduced from, the identity of the target

genes which GAM1237 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17198] Nucleotide sequences of the GAM1237 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1237 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1237 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1237 are further described hereinbelow with reference to Table 1.

[17199] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1237 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17200] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1238 (GAM1238) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17201] GAM1238 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1238 was detected is described hereinabove with reference to Figs. 2-8.

[17202] GAM1238 gene, herein designated GAM GENE, and GAM1238 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17203] GAM1238 gene, herein designated GAM GENE, encodes a GAM1238 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1238 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1238 precursor RNA is designated SEQ ID:1215, and is provided hereinbelow with reference to the sequence listing part.

[17204] GAM1238 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17205] An enzyme complex designated DICER COMPLEX, dices the GAM1238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1238 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1238 RNA is designated SEQ ID:3817, and is provided

hereinbelow with reference to the sequence listing part.

[17206] GAM1238 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1238 target RNA, herein designated GAM TARGET RNA. GAM1238 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17207] GAM1238 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1238 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1238 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1238 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1238 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17208] The complementary binding of GAM1238 RNA, herein designated GAM RNA, to target binding sites on GAM1238 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1238 target RNA, herein designated GAM TARGET RNA, into GAM1238 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17209] It is appreciated that GAM1238 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1238 target genes. The mRNA of each one of this plurality of GAM1238 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1238 RNA, herein designated GAM RNA, and which when bound by GAM1238 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1238 target proteins.

[17210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1238 gene, herein designated GAM GENE, on one or more GAM1238 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17211] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1238 correlate with, and may be deduced from, the identity of the target genes which GAM1238 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17212] Nucleotide sequences of the GAM1238 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1238 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1238 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1238 are further described hereinbelow with reference to Table 1.

[17213] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1238 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17214] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1239 (GAM1239) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17215] GAM1239 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1239 was detected is described hereinabove with reference to Figs. 2-8.

[17216] GAM1239 gene, herein designated GAM GENE, and GAM1239 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17217] GAM1239 gene, herein designated GAM GENE, encodes a GAM1239 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1239 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1239 precursor RNA is designated SEQ ID:1216, and is provided hereinbelow with reference to the sequence listing part.

[17218] GAM1239 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17219] An enzyme complex designated DICER COMPLEX, dices the GAM1239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1239 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1239 RNA is designated SEQ ID:3818, and is provided hereinbelow with reference to the sequence listing part.

[17220] GAM1239 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1239 target RNA, herein designated GAM TARGET RNA. GAM1239 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17221] GAM1239 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1239 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1239 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1239 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1239 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17222] The complementary binding of GAM1239 RNA, herein designated GAM RNA, to target binding sites on GAM1239 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1239 target RNA, herein designated GAM TARGET RNA, into GAM1239 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17223] It is appreciated that GAM1239 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1239 target genes. The mRNA of each one of this plurality of GAM1239 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1239 RNA, herein designated GAM RNA, and which when bound by GAM1239 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1239 target proteins.

[17224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1239 gene, herein designated GAM GENE, on one or more GAM1239 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17225] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1239 correlate with, and may be deduced from, the identity of the target genes which GAM1239 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17226] Nucleotide sequences of the GAM1239 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1239 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1239 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1239 are further described hereinbelow with reference to Table 1.

[17227] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1239 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17228] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1240 (GAM1240) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17229] GAM1240 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1240 was detected is described hereinabove with reference to Figs. 2-8.

[17230] GAM1240 gene, herein designated GAM GENE, and GAM1240 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17231] GAM1240 gene, herein designated GAM GENE, encodes a GAM1240 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1240 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1240 precursor RNA is designated SEQ ID:1217, and is provided hereinbelow with reference to the sequence listing part.

[17232] GAM1240 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17233] An enzyme complex designated DICER COMPLEX, dices the GAM1240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1240 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1240 RNA is designated SEQ ID:3819, and is provided hereinbelow with reference to the sequence listing part.

[17234] GAM1240 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1240 target RNA, herein designated GAM TARGET RNA. GAM1240 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17235] GAM1240 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1240 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1240 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1240 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1240 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17236] The complementary binding of GAM1240 RNA, herein designated GAM RNA, to target binding sites on GAM1240 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1240 target RNA, herein designated GAM TARGET RNA, into GAM1240 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17237] It is appreciated that GAM1240 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1240 target genes. The mRNA of each one of this plurality of GAM1240 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1240 RNA, herein designated GAM RNA, and which when bound by GAM1240 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1240 target proteins.

[17238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1240 gene, herein designated GAM GENE, on one or more GAM1240 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17239] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1240 correlate with, and may be deduced from, the identity of the target genes which GAM1240 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17240] Nucleotide sequences of the GAM1240 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1240 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1240 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1240 are further described hereinbelow with reference to Table 1.

[17241] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1240 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17242] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1241 (GAM1241) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17243] GAM1241 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1241 was detected is described hereinabove with reference to Figs. 2-8.

[17244] GAM1241 gene, herein designated GAM GENE, and GAM1241 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17245] GAM1241 gene, herein designated GAM GENE, encodes a GAM1241 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1241 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1241 precursor RNA is designated SEQ ID:1218, and is provided hereinbelow with reference to the sequence listing part.

[17246] GAM1241 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17247] An enzyme complex designated DICER COMPLEX, dices the GAM1241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1241 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1241 RNA is designated SEQ ID:3820, and is provided hereinbelow with reference to the sequence listing part.

[17248] GAM1241 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1241 target RNA, herein designated GAM TARGET RNA. GAM1241 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17249] GAM1241 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1241 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1241 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1241 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1241 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17250] The complementary binding of GAM1241 RNA, herein designated GAM RNA, to target binding sites on GAM1241 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1241 target RNA, herein designated GAM TARGET RNA, into GAM1241 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17251] It is appreciated that GAM1241 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1241 target genes. The mRNA of each one of this plurality of GAM1241 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1241 RNA, herein designated GAM RNA, and which when bound by GAM1241 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1241 target proteins.

[17252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1241 gene, herein designated GAM GENE, on one or more GAM1241 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17253] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1241 correlate with, and may be deduced from, the identity of the target genes which GAM1241 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17254] Nucleotide sequences of the GAM1241 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1241 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1241 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1241 are further described hereinbelow with reference to Table 1.

[17255] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1241 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17256] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1242 (GAM1242) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17257] GAM1242 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1242 was detected is described hereinabove with reference to Figs. 2-8.

[17258] GAM1242 gene, herein designated GAM GENE, and GAM1242 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17259] GAM1242 gene, herein designated GAM GENE, encodes a GAM1242 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1242 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1242 precursor RNA is designated SEQ ID:1219, and is provided hereinbelow with reference to the sequence listing part.

[17260] GAM1242 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17261] An enzyme complex designated DICER COMPLEX, dices the GAM1242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1242 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1242 RNA is designated SEQ ID:3821, and is provided hereinbelow with reference to the sequence listing part.

[17262] GAM1242 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1242 target RNA, herein designated GAM TARGET RNA. GAM1242 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17263] GAM1242 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1242 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1242 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1242 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1242 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17264] The complementary binding of GAM1242 RNA, herein designated GAM RNA, to target binding sites on GAM1242 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1242 target RNA, herein designated GAM TARGET RNA, into GAM1242 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17265] It is appreciated that GAM1242 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1242 target genes. The

mRNA of each one of this plurality of GAM1242 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1242 RNA, herein designated GAM RNA, and which when bound by GAM1242 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1242 target proteins.

[17266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1242 gene, herein designated GAM GENE, on one or more GAM1242 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17267] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1242 correlate with, and may be deduced from, the identity of the target genes which GAM1242 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17268] Nucleotide sequences of the GAM1242 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1242 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1242 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1242 are further described hereinbelow with reference to Table 1.

[17269] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1242 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17270] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1243 (GAM1243) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17271] GAM1243 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1243 was detected is described hereinabove with reference to Figs. 2-8.

[17272] GAM1243 gene, herein designated GAM GENE, and GAM1243 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17273] GAM1243 gene, herein designated GAM GENE, encodes a GAM1243 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1243 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1243 precursor RNA is designated SEQ ID:1220, and is provided hereinbelow with reference to the sequence listing part.

[17274] GAM1243 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17275] An enzyme complex designated DICER COMPLEX, dices the GAM1243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1243 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1243 RNA is designated SEQ ID:3822, and is provided hereinbelow with reference to the sequence listing part.

[17276] GAM1243 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1243 target RNA, herein designated GAM TARGET RNA. GAM1243 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17277] GAM1243 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1243 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1243 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1243 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1243 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17278] The complementary binding of GAM1243 RNA, herein designated GAM RNA, to target binding sites on GAM1243 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1243 target RNA, herein designated GAM TARGET RNA, into GAM1243 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17279] It is appreciated that GAM1243 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1243 target genes. The mRNA of each one of this plurality of GAM1243 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1243 RNA, herein designated GAM RNA, and which when bound by GAM1243 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1243 target proteins.

[17280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1243 gene, herein designated GAM GENE, on one or more GAM1243 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17281] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1243 correlate with, and may be deduced from, the identity of the target

genes which GAM1243 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17282] Nucleotide sequences of the GAM1243 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1243 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1243 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1243 are further described hereinbelow with reference to Table 1.

[17283] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1243 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17284] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1244 (GAM1244) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17285] GAM1244 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1244 was detected is described hereinabove with reference to Figs. 2-8.

[17286] GAM1244 gene, herein designated GAM GENE, and GAM1244 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17287] GAM1244 gene, herein designated GAM GENE, encodes a GAM1244 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1244 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1244 precursor RNA is designated SEQ ID:1221, and is provided hereinbelow with reference to the sequence listing part.

[17288] GAM1244 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17289] An enzyme complex designated DICER COMPLEX, dices the GAM1244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1244 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1244 RNA is designated SEQ ID:3823, and is provided

hereinbelow with reference to the sequence listing part.

[17290] GAM1244 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1244 target RNA, herein designated GAM TARGET RNA. GAM1244 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17291] GAM1244 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1244 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1244 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1244 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1244 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17292] The complementary binding of GAM1244 RNA, herein designated GAM RNA, to target binding sites on GAM1244 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1244 target RNA, herein designated GAM TARGET RNA, into GAM1244 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17293] It is appreciated that GAM1244 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1244 target genes. The mRNA of each one of this plurality of GAM1244 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1244 RNA, herein designated GAM RNA, and which when bound by GAM1244 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1244 target proteins.

[17294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1244 gene, herein designated GAM GENE, on one or more GAM1244 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17295] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1244 correlate with, and may be deduced from, the identity of the target genes which GAM1244 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17296] Nucleotide sequences of the GAM1244 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1244 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1244 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1244 are further described hereinbelow with reference to Table 1.

[17297] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1244 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17298] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1245 (GAM1245) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17299] GAM1245 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1245 was detected is described hereinabove with reference to Figs. 2-8.

[17300] GAM1245 gene, herein designated GAM GENE, and GAM1245 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17301] GAM1245 gene, herein designated GAM GENE, encodes a GAM1245 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1245 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1245 precursor RNA is designated SEQ ID:1222, and is provided hereinbelow with reference to the sequence listing part.

[17302] GAM1245 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17303] An enzyme complex designated DICER COMPLEX, dices the GAM1245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1245 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1245 RNA is designated SEQ ID:3824, and is provided hereinbelow with reference to the sequence listing part.

[17304] GAM1245 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1245 target RNA, herein designated GAM TARGET RNA. GAM1245 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17305] GAM1245 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1245 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1245 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1245 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1245 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17306] The complementary binding of GAM1245 RNA, herein designated GAM RNA, to target binding sites on GAM1245 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1245 target RNA, herein designated GAM TARGET RNA, into GAM1245 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17307] It is appreciated that GAM1245 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1245 target genes. The mRNA of each one of this plurality of GAM1245 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1245 RNA, herein designated GAM RNA, and which when bound by GAM1245 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1245 target proteins.

[17308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1245 gene, herein designated GAM GENE, on one or more GAM1245 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17309] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1245 correlate with, and may be deduced from, the identity of the target genes which GAM1245 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17310] Nucleotide sequences of the GAM1245 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1245 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1245 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1245 are further described hereinbelow with reference to Table 1.

[17311] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1245 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17312] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1246 (GAM1246) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17313] GAM1246 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1246 was detected is described hereinabove with reference to Figs. 2-8.

[17314] GAM1246 gene, herein designated GAM GENE, and GAM1246 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17315] GAM1246 gene, herein designated GAM GENE, encodes a GAM1246 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1246 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1246 precursor RNA is designated SEQ ID:1223, and is provided hereinbelow with reference to the sequence listing part.

[17316] GAM1246 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17317] An enzyme complex designated DICER COMPLEX, dices the GAM1246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1246 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1246 RNA is designated SEQ ID:3825, and is provided hereinbelow with reference to the sequence listing part.

[17318] GAM1246 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1246 target RNA, herein designated GAM TARGET RNA. GAM1246 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17319] GAM1246 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1246 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1246 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1246 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1246 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17320] The complementary binding of GAM1246 RNA, herein designated GAM RNA, to target binding sites on GAM1246 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1246 target RNA, herein designated GAM TARGET RNA, into GAM1246 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17321] It is appreciated that GAM1246 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1246 target genes. The mRNA of each one of this plurality of GAM1246 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1246 RNA, herein designated GAM RNA, and which when bound by GAM1246 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1246 target proteins.

[17322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1246 gene, herein designated GAM GENE, on one or more GAM1246 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17323] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1246 correlate with, and may be deduced from, the identity of the target genes which GAM1246 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17324] Nucleotide sequences of the GAM1246 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1246 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1246 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1246 are further described hereinbelow with reference to Table 1.

[17325] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1246 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17326] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1247 (GAM1247) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17327] GAM1247 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1247 was detected is described hereinabove with reference to Figs. 2-8.

[17328] GAM1247 gene, herein designated GAM GENE, and GAM1247 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17329] GAM1247 gene, herein designated GAM GENE, encodes a GAM1247 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1247 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1247 precursor RNA is designated SEQ ID:1224, and is provided hereinbelow with reference to the sequence listing part.

[17330] GAM1247 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17331] An enzyme complex designated DICER COMPLEX, dices the GAM1247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1247 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1247 RNA is designated SEQ ID:3826, and is provided hereinbelow with reference to the sequence listing part.

[17332] GAM1247 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1247 target RNA, herein designated GAM TARGET RNA. GAM1247 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17333] GAM1247 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1247 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1247 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1247 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1247 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17334] The complementary binding of GAM1247 RNA, herein designated GAM RNA, to target binding sites on GAM1247 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1247 target RNA, herein designated GAM TARGET RNA, into GAM1247 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17335] It is appreciated that GAM1247 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1247 target genes. The mRNA of each one of this plurality of GAM1247 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1247 RNA, herein designated GAM RNA, and which when bound by GAM1247 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1247 target proteins.

[17336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1247 gene, herein designated GAM GENE, on one or more GAM1247 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17337] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1247 correlate with, and may be deduced from, the identity of the target genes which GAM1247 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17338] Nucleotide sequences of the GAM1247 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1247 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1247 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1247 are further described hereinbelow with reference to Table 1.

[17339] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1247 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17340] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1248 (GAM1248) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17341] GAM1248 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1248 was detected is described hereinabove with reference to Figs. 2-8.

[17342] GAM1248 gene, herein designated GAM GENE, and GAM1248 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17343] GAM1248 gene, herein designated GAM GENE, encodes a GAM1248 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1248 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1248 precursor RNA is designated SEQ ID:1225, and is provided hereinbelow with reference to the sequence listing part.

[17344] GAM1248 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17345] An enzyme complex designated DICER COMPLEX, dices the GAM1248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1248 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1248 RNA is designated SEQ ID:3827, and is provided hereinbelow with reference to the sequence listing part.

[17346] GAM1248 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1248 target RNA, herein designated GAM TARGET RNA. GAM1248 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17347] GAM1248 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1248 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1248 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1248 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1248 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17348] The complementary binding of GAM1248 RNA, herein designated GAM RNA, to target binding sites on GAM1248 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1248 target RNA, herein designated GAM TARGET RNA, into GAM1248 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17349] It is appreciated that GAM1248 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1248 target genes. The mRNA of each one of this plurality of GAM1248 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1248 RNA, herein designated GAM RNA, and which when bound by GAM1248 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1248 target proteins.

[17350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1248 gene, herein designated GAM GENE, on one or more GAM1248 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17351] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1248 correlate with, and may be deduced from, the identity of the target genes which GAM1248 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17352] Nucleotide sequences of the GAM1248 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1248 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1248 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1248 are further described hereinbelow with reference to Table 1.

[17353] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1248 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17354] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1249 (GAM1249) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17355] GAM1249 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1249 was detected is described hereinabove with reference to Figs. 2-8.

[17356] GAM1249 gene, herein designated GAM GENE, and GAM1249 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17357] GAM1249 gene, herein designated GAM GENE, encodes a GAM1249

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1249 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1249 precursor RNA is designated SEQ ID:1226, and is provided hereinbelow with reference to the sequence listing part.

[17358] GAM1249 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1249 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17359] An enzyme complex designated DICER COMPLEX, dices the GAM1249 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1249 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1249 RNA is designated SEQ ID:3828, and is provided hereinbelow with reference to the sequence listing part.

[17360] GAM1249 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM1249 target RNA, herein designated GAM TARGET RNA. GAM1249 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17361] GAM1249 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1249 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1249 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1249 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1249 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17362] The complementary binding of GAM1249 RNA, herein designated GAM RNA, to target binding sites on GAM1249 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of GAM1249 target RNA, herein designated GAM TARGET RNA, into GAM1249 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17363] It is appreciated that GAM1249 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1249 target genes. The mRNA of each one of this plurality of GAM1249 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1249 RNA, herein designated GAM RNA, and which when bound by GAM1249 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1249 target proteins.

[17364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1249 gene, herein designated GAM GENE, on one or more GAM1249 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17365] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1249 correlate with, and may be deduced from, the identity of the target genes which GAM1249 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17366] Nucleotide sequences of the GAM1249 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1249 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1249 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1249 are further described hereinbelow with reference to Table 1.

[17367] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1249 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17368] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1250 (GAM1250) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17369] GAM1250 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1250 was detected is described hereinabove with reference to Figs. 2-8.

[17370] GAM1250 gene, herein designated GAM GENE, and GAM1250 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17371] GAM1250 gene, herein designated GAM GENE, encodes a GAM1250 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1250 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1250 precursor RNA is designated SEQ ID:1227, and is provided hereinbelow with reference to the sequence listing part.

[17372] GAM1250 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17373] An enzyme complex designated DICER COMPLEX, dices the GAM1250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1250 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1250 RNA is designated SEQ ID:3829, and is provided hereinbelow with reference to the sequence listing part.

[17374] GAM1250 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1250 target RNA, herein designated GAM TARGET RNA. GAM1250 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17375] GAM1250 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1250 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1250 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1250 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1250 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[17376] The complementary binding of GAM1250 RNA, herein designated GAM RNA, to target binding sites on GAM1250 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1250 target RNA, herein designated GAM TARGET RNA, into GAM1250 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17377] It is appreciated that GAM1250 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1250 target genes. The mRNA of each one of this plurality of GAM1250 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1250 RNA, herein designated GAM RNA, and which when bound by GAM1250 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1250 target proteins.

[17378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1250 gene, herein designated GAM GENE, on one or more GAM1250 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17379] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1250 correlate with, and may be deduced from, the identity of the target genes which GAM1250 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17380] Nucleotide sequences of the GAM1250 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1250 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1250 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1250 are further described hereinbelow with reference to Table 1.

[17381] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1250 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17382] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1251 (GAM1251) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17383] GAM1251 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1251 was detected is described hereinabove with reference to Figs. 2-8.

[17384] GAM1251 gene, herein designated GAM GENE, and GAM1251 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17385] GAM1251 gene, herein designated GAM GENE, encodes a GAM1251 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1251 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1251 precursor RNA is designated SEQ ID:1228, and is provided hereinbelow with reference to the sequence listing part.

[17386] GAM1251 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17387] An enzyme complex designated DICER COMPLEX, dices the GAM1251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1251 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1251 RNA is designated SEQ ID:3830, and is provided hereinbelow with reference to the sequence listing part.

[17388] GAM1251 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1251 target RNA, herein designated GAM TARGET RNA. GAM1251 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17389] GAM1251 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1251 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1251 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1251 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1251 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17390] The complementary binding of GAM1251 RNA, herein designated GAM RNA, to target binding sites on GAM1251 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1251 target RNA, herein designated GAM TARGET RNA, into GAM1251 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17391] It is appreciated that GAM1251 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1251 target genes. The mRNA of each one of this plurality of GAM1251 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1251 RNA, herein designated GAM RNA, and which when bound by GAM1251 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1251 target proteins.

[17392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1251 gene, herein designated GAM GENE, on one or more GAM1251 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17393] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1251 correlate with, and may be deduced from, the identity of the target genes which GAM1251 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17394] Nucleotide sequences of the GAM1251 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1251 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1251 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1251 are further described hereinbelow with reference to Table 1.

[17395] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1251 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17396] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1252 (GAM1252) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17397] GAM1252 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1252 was detected is described hereinabove with reference to Figs. 2-8.

[17398] GAM1252 gene, herein designated GAM GENE, and GAM1252 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17399] GAM1252 gene, herein designated GAM GENE, encodes a GAM1252 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1252 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1252 precursor RNA is designated SEQ ID:1229, and is provided hereinbelow with reference to the sequence listing part.

[17400] GAM1252 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17401] An enzyme complex designated DICER COMPLEX, dices the GAM1252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1252 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1252 RNA is designated SEQ ID:3831, and is provided hereinbelow with reference to the sequence listing part.

[17402] GAM1252 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1252 target RNA, herein designated GAM TARGET RNA. GAM1252 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17403] GAM1252 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1252 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1252 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1252 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1252 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17404] The complementary binding of GAM1252 RNA, herein designated GAM RNA, to target binding sites on GAM1252 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1252 target RNA, herein designated GAM TARGET RNA, into GAM1252 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17405] It is appreciated that GAM1252 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1252 target genes. The mRNA of each one of this plurality of GAM1252 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1252 RNA, herein designated GAM RNA, and which when bound by GAM1252 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1252 target proteins.

[17406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1252 gene, herein designated GAM GENE, on one or more GAM1252 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17407] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1252 correlate with, and may be deduced from, the identity of the target genes which GAM1252 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17408] Nucleotide sequences of the GAM1252 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1252 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1252 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1252 are further described hereinbelow with reference to Table 1.

[17409] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1252 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17410] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1253 (GAM1253) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17411] GAM1253 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1253 was detected is described hereinabove with reference to Figs. 2-8.

[17412] GAM1253 gene, herein designated GAM GENE, and GAM1253 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17413] GAM1253 gene, herein designated GAM GENE, encodes a GAM1253 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1253 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1253 precursor RNA is designated SEQ ID:1230, and is provided hereinbelow with reference to the sequence listing part.

[17414] GAM1253 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1253 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17415] An enzyme complex designated DICER COMPLEX, dices the GAM1253 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1253 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1253 RNA is designated SEQ ID:3832, and is provided hereinbelow with reference to the sequence listing part.

[17416] GAM1253 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1253 target RNA, herein designated GAM TARGET RNA. GAM1253 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17417] GAM1253 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1253 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1253 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1253 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1253 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17418] The complementary binding of GAM1253 RNA, herein designated GAM RNA, to target binding sites on GAM1253 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1253 target RNA, herein designated GAM TARGET RNA, into GAM1253 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17419] It is appreciated that GAM1253 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1253 target genes. The mRNA of each one of this plurality of GAM1253 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1253 RNA, herein designated GAM RNA, and which when bound by GAM1253 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1253 target proteins.

[17420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1253 gene, herein designated GAM GENE, on one or more GAM1253 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17421] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1253 correlate with, and may be deduced from, the identity of the target genes which GAM1253 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17422] Nucleotide sequences of the GAM1253 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1253 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1253 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1253 are further described hereinbelow with reference to Table 1.

[17423] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1253 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17424] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1254 (GAM1254) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17425] GAM1254 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1254 was detected is described hereinabove with reference to Figs. 2-8.

[17426] GAM1254 gene, herein designated GAM GENE, and GAM1254 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17427] GAM1254 gene, herein designated GAM GENE, encodes a GAM1254 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1254 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1254 precursor RNA is designated SEQ ID:1231, and is provided hereinbelow with reference to the sequence listing part.

[17428] GAM1254 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17429] An enzyme complex designated DICER COMPLEX, dices the GAM1254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1254 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1254 RNA is designated SEQ ID:3833, and is provided hereinbelow with reference to the sequence listing part.

[17430] GAM1254 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1254 target RNA, herein designated GAM TARGET RNA. GAM1254 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17431] GAM1254 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1254 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1254 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1254 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1254 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17432] The complementary binding of GAM1254 RNA, herein designated GAM RNA, to target binding sites on GAM1254 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1254 target RNA, herein designated GAM TARGET RNA, into GAM1254 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17433] It is appreciated that GAM1254 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1254 target genes. The

mRNA of each one of this plurality of GAM1254 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1254 RNA, herein designated GAM RNA, and which when bound by GAM1254 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1254 target proteins.

[17434] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1254 gene, herein designated GAM GENE, on one or more GAM1254 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17435] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1254 correlate with, and may be deduced from, the identity of the target genes which GAM1254 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17436] Nucleotide sequences of the GAM1254 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1254 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1254 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1254 are further described hereinbelow with reference to Table 1.

[17437] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1254 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17438] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1255 (GAM1255) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17439] GAM1255 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1255 was detected is described hereinabove with reference to Figs. 2-8.

[17440] GAM1255 gene, herein designated GAM GENE, and GAM1255 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17441] GAM1255 gene, herein designated GAM GENE, encodes a GAM1255 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1255 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1255 precursor RNA is designated SEQ ID:1232, and is provided hereinbelow with reference to the sequence listing part.

[17442] GAM1255 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17443] An enzyme complex designated DICER COMPLEX, dices the GAM1255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1255 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1255 RNA is designated SEQ ID:3834, and is provided hereinbelow with reference to the sequence listing part.

[17444] GAM1255 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1255 target RNA, herein designated GAM TARGET RNA. GAM1255 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17445] GAM1255 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1255 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1255 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1255 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1255 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17446] The complementary binding of GAM1255 RNA, herein designated GAM RNA, to target binding sites on GAM1255 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1255 target RNA, herein designated GAM TARGET RNA, into GAM1255 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17447] It is appreciated that GAM1255 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1255 target genes. The mRNA of each one of this plurality of GAM1255 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1255 RNA, herein designated GAM RNA, and which when bound by GAM1255 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1255 target proteins.

[17448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1255 gene, herein designated GAM GENE, on one or more GAM1255 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17449] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1255 correlate with, and may be deduced from, the identity of the target

genes which GAM1255 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17450] Nucleotide sequences of the GAM1255 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1255 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1255 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1255 are further described hereinbelow with reference to Table 1.

[17451] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1255 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17452] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1256 (GAM1256) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17453] GAM1256 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1256 was detected is described hereinabove with reference to Figs. 2-8.

[17454] GAM1256 gene, herein designated GAM GENE, and GAM1256 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17455] GAM1256 gene, herein designated GAM GENE, encodes a GAM1256 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1256 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1256 precursor RNA is designated SEQ ID:1233, and is provided hereinbelow with reference to the sequence listing part.

[17456] GAM1256 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17457] An enzyme complex designated DICER COMPLEX, dices the GAM1256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1256 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1256 RNA is designated SEQ ID:3835, and is provided

hereinbelow with reference to the sequence listing part.

[17458] GAM1256 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1256 target RNA, herein designated GAM TARGET RNA. GAM1256 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17459] GAM1256 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1256 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1256 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1256 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1256 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17460] The complementary binding of GAM1256 RNA, herein designated GAM RNA, to target binding sites on GAM1256 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1256 target RNA, herein designated GAM TARGET RNA, into GAM1256 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17461] It is appreciated that GAM1256 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1256 target genes. The mRNA of each one of this plurality of GAM1256 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1256 RNA, herein designated GAM RNA, and which when bound by GAM1256 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1256 target proteins.

[17462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1256 gene, herein designated GAM GENE, on one or more GAM1256 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17463] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1256 correlate with, and may be deduced from, the identity of the target genes which GAM1256 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17464] Nucleotide sequences of the GAM1256 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1256 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1256 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1256 are further described hereinbelow with reference to Table 1.

[17465] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1256 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17466] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1257 (GAM1257) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17467] GAM1257 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1257 was detected is described hereinabove with reference to Figs. 2-8.

[17468] GAM1257 gene, herein designated GAM GENE, and GAM1257 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17469] GAM1257 gene, herein designated GAM GENE, encodes a GAM1257 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1257 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1257 precursor RNA is designated SEQ ID:1234, and is provided hereinbelow with reference to the sequence listing part.

[17470] GAM1257 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17471] An enzyme complex designated DICER COMPLEX, dices the GAM1257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1257 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1257 RNA is designated SEQ ID:3836, and is provided hereinbelow with reference to the sequence listing part.

[17472] GAM1257 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1257 target RNA, herein designated GAM TARGET RNA. GAM1257 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17473] GAM1257 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1257 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1257 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1257 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1257 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17474] The complementary binding of GAM1257 RNA, herein designated GAM RNA, to target binding sites on GAM1257 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1257 target RNA, herein designated GAM TARGET RNA, into GAM1257 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17475] It is appreciated that GAM1257 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1257 target genes. The mRNA of each one of this plurality of GAM1257 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1257 RNA, herein designated GAM RNA, and which when bound by GAM1257 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1257 target proteins.

[17476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1257 gene, herein designated GAM GENE, on one or more GAM1257 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17477] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1257 correlate with, and may be deduced from, the identity of the target genes which GAM1257 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17478] Nucleotide sequences of the GAM1257 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1257 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1257 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1257 are further described hereinbelow with reference to Table 1.

[17479] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1257 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17480] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1258 (GAM1258) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17481] GAM1258 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1258 was detected is described hereinabove with reference to Figs. 2-8.

[17482] GAM1258 gene, herein designated GAM GENE, and GAM1258 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17483] GAM1258 gene, herein designated GAM GENE, encodes a GAM1258 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1258 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1258 precursor RNA is designated SEQ ID:1235, and is provided hereinbelow with reference to the sequence listing part.

[17484] GAM1258 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17485] An enzyme complex designated DICER COMPLEX, dices the GAM1258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1258 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1258 RNA is designated SEQ ID:3837, and is provided hereinbelow with reference to the sequence listing part.

[17486] GAM1258 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1258 target RNA, herein designated GAM TARGET RNA. GAM1258 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17487] GAM1258 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1258 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1258 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1258 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1258 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17488] The complementary binding of GAM1258 RNA, herein designated GAM RNA, to target binding sites on GAM1258 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1258 target RNA, herein designated GAM TARGET RNA, into GAM1258 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17489] It is appreciated that GAM1258 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1258 target genes. The mRNA of each one of this plurality of GAM1258 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1258 RNA, herein designated GAM RNA, and which when bound by GAM1258 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1258 target proteins.

[17490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1258 gene, herein designated GAM GENE, on one or more GAM1258 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17491] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1258 correlate with, and may be deduced from, the identity of the target genes which GAM1258 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17492] Nucleotide sequences of the GAM1258 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1258 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1258 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1258 are further described hereinbelow with reference to Table 1.

[17493] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1258 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17494] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1259 (GAM1259) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17495] GAM1259 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1259 was detected is described hereinabove with reference to Figs. 2-8.

[17496] GAM1259 gene, herein designated GAM GENE, and GAM1259 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17497] GAM1259 gene, herein designated GAM GENE, encodes a GAM1259 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1259 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1259 precursor RNA is designated SEQ ID:1236, and is provided hereinbelow with reference to the sequence listing part.

[17498] GAM1259 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17499] An enzyme complex designated DICER COMPLEX, dices the GAM1259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1259 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1259 RNA is designated SEQ ID:3838, and is provided hereinbelow with reference to the sequence listing part.

[17500] GAM1259 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1259 target RNA, herein designated GAM TARGET RNA. GAM1259 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17501] GAM1259 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1259 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1259 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1259 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1259 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17502] The complementary binding of GAM1259 RNA, herein designated GAM RNA, to target binding sites on GAM1259 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1259 target RNA, herein designated GAM TARGET RNA, into GAM1259 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17503] It is appreciated that GAM1259 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1259 target genes. The mRNA of each one of this plurality of GAM1259 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1259 RNA, herein designated GAM RNA, and which when bound by GAM1259 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1259 target proteins.

[17504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1259 gene, herein designated GAM GENE, on one or more GAM1259 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17505] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1259 correlate with, and may be deduced from, the identity of the target genes which GAM1259 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17506] Nucleotide sequences of the GAM1259 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1259 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1259 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1259 are further described hereinbelow with reference to Table 1.

[17507] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1259 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17508] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1260 (GAM1260) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17509] GAM1260 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1260 was detected is described hereinabove with reference to Figs. 2-8.

[17510] GAM1260 gene, herein designated GAM GENE, and GAM1260 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17511] GAM1260 gene, herein designated GAM GENE, encodes a GAM1260 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1260 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1260 precursor RNA is designated SEQ ID:1237, and is provided hereinbelow with reference to the sequence listing part.

[17512] GAM1260 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17513] An enzyme complex designated DICER COMPLEX, dices the GAM1260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1260 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1260 RNA is designated SEQ ID:3841, and is provided hereinbelow with reference to the sequence listing part.

[17514] GAM1260 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1260 target RNA, herein designated GAM TARGET RNA. GAM1260 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17515] GAM1260 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1260 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1260 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1260 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1260 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17516] The complementary binding of GAM1260 RNA, herein designated GAM RNA, to target binding sites on GAM1260 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1260 target RNA, herein designated GAM TARGET RNA, into GAM1260 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17517] It is appreciated that GAM1260 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1260 target genes. The

mRNA of each one of this plurality of GAM1260 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1260 RNA, herein designated GAM RNA, and which when bound by GAM1260 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1260 target proteins.

[17518] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1260 gene, herein designated GAM GENE, on one or more GAM1260 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17519] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1260 correlate with, and may be deduced from, the identity of the target genes which GAM1260 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17520] Nucleotide sequences of the GAM1260 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1260 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1260 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1260 are further described hereinbelow with reference to Table 1.

[17521] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1260 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17522] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1261 (GAM1261) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17523] GAM1261 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1261 was detected is described hereinabove with reference to Figs. 2-8.

[17524] GAM1261 gene, herein designated GAM GENE, and GAM1261 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17525] GAM1261 gene, herein designated GAM GENE, encodes a GAM1261 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1261 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1261 precursor RNA is designated SEQ ID:1238, and is provided hereinbelow with reference to the sequence listing part.

[17526] GAM1261 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17527] An enzyme complex designated DICER COMPLEX, dices the GAM1261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1261 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1261 RNA is designated SEQ ID:3839, and is provided hereinbelow with reference to the sequence listing part.

[17528] GAM1261 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1261 target RNA, herein designated GAM TARGET RNA. GAM1261 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17529] GAM1261 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1261 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1261 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1261 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1261 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17530] The complementary binding of GAM1261 RNA, herein designated GAM RNA, to target binding sites on GAM1261 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1261 target RNA, herein designated GAM TARGET RNA, into GAM1261 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17531] It is appreciated that GAM1261 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1261 target genes. The mRNA of each one of this plurality of GAM1261 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1261 RNA, herein designated GAM RNA, and which when bound by GAM1261 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1261 target proteins.

[17532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1261 gene, herein designated GAM GENE, on one or more GAM1261 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17533] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1261 correlate with, and may be deduced from, the identity of the target

genes which GAM1261 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17534] Nucleotide sequences of the GAM1261 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1261 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1261 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1261 are further described hereinbelow with reference to Table 1.

[17535] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1261 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17536] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1262 (GAM1262) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17537] GAM1262 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1262 was detected is described hereinabove with reference to Figs. 2-8.

[17538] GAM1262 gene, herein designated GAM GENE, and GAM1262 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17539] GAM1262 gene, herein designated GAM GENE, encodes a GAM1262 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1262 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1262 precursor RNA is designated SEQ ID:1239, and is provided hereinbelow with reference to the sequence listing part.

[17540] GAM1262 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17541] An enzyme complex designated DICER COMPLEX, dices the GAM1262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1262 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1262 RNA is designated SEQ ID:3840, and is provided

hereinbelow with reference to the sequence listing part.

[17542] GAM1262 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1262 target RNA, herein designated GAM TARGET RNA. GAM1262 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17543] GAM1262 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1262 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1262 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1262 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1262 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17544] The complementary binding of GAM1262 RNA, herein designated GAM RNA, to target binding sites on GAM1262 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1262 target RNA, herein designated GAM TARGET RNA, into GAM1262 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17545] It is appreciated that GAM1262 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1262 target genes. The mRNA of each one of this plurality of GAM1262 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1262 RNA, herein designated GAM RNA, and which when bound by GAM1262 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1262 target proteins.

[17546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1262 gene, herein designated GAM GENE, on one or more GAM1262 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17547] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1262 correlate with, and may be deduced from, the identity of the target genes which GAM1262 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17548] Nucleotide sequences of the GAM1262 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1262 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1262 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1262 are further described hereinbelow with reference to Table 1.

[17549] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1262 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17550] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1263 (GAM1263) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17551] GAM1263 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1263 was detected is described hereinabove with reference to Figs. 2-8.

[17552] GAM1263 gene, herein designated GAM GENE, and GAM1263 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17553] GAM1263 gene, herein designated GAM GENE, encodes a GAM1263 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1263 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1263 precursor RNA is designated SEQ ID:1240, and is provided hereinbelow with reference to the sequence listing part.

[17554] GAM1263 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17555] An enzyme complex designated DICER COMPLEX, dices the GAM1263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1263 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1263 RNA is designated SEQ ID:3842, and is provided hereinbelow with reference to the sequence listing part.

[17556] GAM1263 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1263 target RNA, herein designated GAM TARGET RNA. GAM1263 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17557] GAM1263 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1263 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1263 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1263 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1263 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17558] The complementary binding of GAM1263 RNA, herein designated GAM RNA, to target binding sites on GAM1263 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1263 target RNA, herein designated GAM TARGET RNA, into GAM1263 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17559] It is appreciated that GAM1263 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1263 target genes. The mRNA of each one of this plurality of GAM1263 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1263 RNA, herein designated GAM RNA, and which when bound by GAM1263 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1263 target proteins.

[17560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1263 gene, herein designated GAM GENE, on one or more GAM1263 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17561] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1263 correlate with, and may be deduced from, the identity of the target genes which GAM1263 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17562] Nucleotide sequences of the GAM1263 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1263 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1263 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1263 are further described hereinbelow with reference to Table 1.

[17563] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1263 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17564] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1264 (GAM1264) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17565] GAM1264 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1264 was detected is described hereinabove with reference to Figs. 2-8.

[17566] GAM1264 gene, herein designated GAM GENE, and GAM1264 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17567] GAM1264 gene, herein designated GAM GENE, encodes a GAM1264 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1264 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1264 precursor RNA is designated SEQ ID:1241, and is provided hereinbelow with reference to the sequence listing part.

[17568] GAM1264 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17569] An enzyme complex designated DICER COMPLEX, dices the GAM1264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1264 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1264 RNA is designated SEQ ID:3843, and is provided hereinbelow with reference to the sequence listing part.

[17570] GAM1264 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1264 target RNA, herein designated GAM TARGET RNA. GAM1264 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17571] GAM1264 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1264 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1264 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1264 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1264 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17572] The complementary binding of GAM1264 RNA, herein designated GAM RNA, to target binding sites on GAM1264 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1264 target RNA, herein designated GAM TARGET RNA, into GAM1264 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17573] It is appreciated that GAM1264 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1264 target genes. The mRNA of each one of this plurality of GAM1264 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1264 RNA, herein designated GAM RNA, and which when bound by GAM1264 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1264 target proteins.

[17574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1264 gene, herein designated GAM GENE, on one or more GAM1264 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17575] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1264 correlate with, and may be deduced from, the identity of the target genes which GAM1264 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17576] Nucleotide sequences of the GAM1264 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1264 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1264 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1264 are further described hereinbelow with reference to Table 1.

[17577] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1264 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17578] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1265 (GAM1265) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17579] GAM1265 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1265 was detected is described hereinabove with reference to Figs. 2-8.

[17580] GAM1265 gene, herein designated GAM GENE, and GAM1265 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17581] GAM1265 gene, herein designated GAM GENE, encodes a GAM1265 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1265 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1265 precursor RNA is designated SEQ ID:1242, and is provided hereinbelow with reference to the sequence listing part.

[17582] GAM1265 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17583] An enzyme complex designated DICER COMPLEX, dices the GAM1265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1265 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1265 RNA is designated SEQ ID:3844, and is provided hereinbelow with reference to the sequence listing part.

[17584] GAM1265 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1265 target RNA, herein designated GAM TARGET RNA. GAM1265 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17585] GAM1265 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1265 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1265 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1265 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1265 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17586] The complementary binding of GAM1265 RNA, herein designated GAM RNA, to target binding sites on GAM1265 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1265 target RNA, herein designated GAM TARGET RNA, into GAM1265 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17587] It is appreciated that GAM1265 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1265 target genes. The mRNA of each one of this plurality of GAM1265 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1265 RNA, herein designated GAM RNA, and which when bound by GAM1265 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1265 target proteins.

[17588] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1265 gene, herein designated GAM GENE, on one or more GAM1265 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17589] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1265 correlate with, and may be deduced from, the identity of the target genes which GAM1265 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17590] Nucleotide sequences of the GAM1265 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1265 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1265 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1265 are further described hereinbelow with reference to Table 1.

[17591] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1265 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17592] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1266 (GAM1266) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17593] GAM1266 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1266 was detected is described hereinabove with reference to Figs. 2-8.

[17594] GAM1266 gene, herein designated GAM GENE, and GAM1266 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17595] GAM1266 gene, herein designated GAM GENE, encodes a GAM1266 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1266 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1266 precursor RNA is designated SEQ ID:1243, and is provided hereinbelow with reference to the sequence listing part.

[17596] GAM1266 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17597] An enzyme complex designated DICER COMPLEX, dices the GAM1266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1266 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1266 RNA is designated SEQ ID:3845, and is provided hereinbelow with reference to the sequence listing part.

[17598] GAM1266 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1266 target RNA, herein designated GAM TARGET RNA. GAM1266 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17599] GAM1266 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1266 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1266 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1266 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1266 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17600] The complementary binding of GAM1266 RNA, herein designated GAM RNA, to target binding sites on GAM1266 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1266 target RNA, herein designated GAM TARGET RNA, into GAM1266 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17601] It is appreciated that GAM1266 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1266 target genes. The

mRNA of each one of this plurality of GAM1266 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1266 RNA, herein designated GAM RNA, and which when bound by GAM1266 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1266 target proteins.

[17602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1266 gene, herein designated GAM GENE, on one or more GAM1266 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17603] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1266 correlate with, and may be deduced from, the identity of the target genes which GAM1266 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17604] Nucleotide sequences of the GAM1266 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1266 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1266 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1266 are further described hereinbelow with reference to Table 1.

[17605] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1266 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17606] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1267 (GAM1267) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17607] GAM1267 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1267 was detected is described hereinabove with reference to Figs. 2-8.

[17608] GAM1267 gene, herein designated GAM GENE, and GAM1267 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17609] GAM1267 gene, herein designated GAM GENE, encodes a GAM1267 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1267 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1267 precursor RNA is designated SEQ ID:1244, and is provided hereinbelow with reference to the sequence listing part.

[17610] GAM1267 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17611] An enzyme complex designated DICER COMPLEX, dices the GAM1267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1267 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1267 RNA is designated SEQ ID:3846, and is provided hereinbelow with reference to the sequence listing part.

[17612] GAM1267 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1267 target RNA, herein designated GAM TARGET RNA. GAM1267 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17613] GAM1267 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1267 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1267 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1267 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1267 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17614] The complementary binding of GAM1267 RNA, herein designated GAM RNA, to target binding sites on GAM1267 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1267 target RNA, herein designated GAM TARGET RNA, into GAM1267 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17615] It is appreciated that GAM1267 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1267 target genes. The mRNA of each one of this plurality of GAM1267 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1267 RNA, herein designated GAM RNA, and which when bound by GAM1267 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1267 target proteins.

[17616] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1267 gene, herein designated GAM GENE, on one or more GAM1267 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17617] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1267 correlate with, and may be deduced from, the identity of the target

genes which GAM1267 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17618] Nucleotide sequences of the GAM1267 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1267 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1267 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1267 are further described hereinbelow with reference to Table 1.

[17619] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1267 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17620] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1268 (GAM1268) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17621] GAM1268 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1268 was detected is described hereinabove with reference to Figs. 2-8.

[17622] GAM1268 gene, herein designated GAM GENE, and GAM1268 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17623] GAM1268 gene, herein designated GAM GENE, encodes a GAM1268 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1268 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1268 precursor RNA is designated SEQ ID:1245, and is provided hereinbelow with reference to the sequence listing part.

[17624] GAM1268 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1268 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17625] An enzyme complex designated DICER COMPLEX, dices the GAM1268 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1268 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1268 RNA is designated SEQ ID:3847, and is provided

hereinbelow with reference to the sequence listing part.

[17626] GAM1268 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1268 target RNA, herein designated GAM TARGET RNA. GAM1268 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17627] GAM1268 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1268 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1268 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1268 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1268 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17628] The complementary binding of GAM1268 RNA, herein designated GAM RNA, to target binding sites on GAM1268 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1268 target RNA, herein designated GAM TARGET RNA, into GAM1268 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17629] It is appreciated that GAM1268 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1268 target genes. The mRNA of each one of this plurality of GAM1268 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1268 RNA, herein designated GAM RNA, and which when bound by GAM1268 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1268 target proteins.

[17630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1268 gene, herein designated GAM GENE, on one or more GAM1268 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17631] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1268 correlate with, and may be deduced from, the identity of the target genes which GAM1268 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17632] Nucleotide sequences of the GAM1268 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1268 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1268 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1268 are further described hereinbelow with reference to Table 1.

[17633] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1268 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17634] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1269 (GAM1269) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17635] GAM1269 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1269 was detected is described hereinabove with reference to Figs. 2-8.

[17636] GAM1269 gene, herein designated GAM GENE, and GAM1269 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17637] GAM1269 gene, herein designated GAM GENE, encodes a GAM1269 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1269 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1269 precursor RNA is designated SEQ ID:1246, and is provided hereinbelow with reference to the sequence listing part.

[17638] GAM1269 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17639] An enzyme complex designated DICER COMPLEX, dices the GAM1269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1269 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1269 RNA is designated SEQ ID:3848, and is provided hereinbelow with reference to the sequence listing part.

[17640] GAM1269 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1269 target RNA, herein designated GAM TARGET RNA. GAM1269 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17641] GAM1269 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1269 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1269 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1269 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1269 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17642] The complementary binding of GAM1269 RNA, herein designated GAM RNA, to target binding sites on GAM1269 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1269 target RNA, herein designated GAM TARGET RNA, into GAM1269 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17643] It is appreciated that GAM1269 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1269 target genes. The mRNA of each one of this plurality of GAM1269 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1269 RNA, herein designated GAM RNA, and which when bound by GAM1269 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1269 target proteins.

[17644] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1269 gene, herein designated GAM GENE, on one or more GAM1269 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17645] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1269 correlate with, and may be deduced from, the identity of the target genes which GAM1269 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17646] Nucleotide sequences of the GAM1269 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1269 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1269 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1269 are further described hereinbelow with reference to Table 1.

[17647] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1269 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17648] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1270 (GAM1270) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17649] GAM1270 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1270 was detected is described hereinabove with reference to Figs. 2-8.

[17650] GAM1270 gene, herein designated GAM GENE, and GAM1270 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17651] GAM1270 gene, herein designated GAM GENE, encodes a GAM1270 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1270 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1270 precursor RNA is designated SEQ ID:1247, and is provided hereinbelow with reference to the sequence listing part.

[17652] GAM1270 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17653] An enzyme complex designated DICER COMPLEX, dices the GAM1270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1270 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1270 RNA is designated SEQ ID:3850, and is provided hereinbelow with reference to the sequence listing part.

[17654] GAM1270 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1270 target RNA, herein designated GAM TARGET RNA. GAM1270 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17655] GAM1270 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1270 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1270 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1270 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1270 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17656] The complementary binding of GAM1270 RNA, herein designated GAM RNA, to target binding sites on GAM1270 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1270 target RNA, herein designated GAM TARGET RNA, into GAM1270 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17657] It is appreciated that GAM1270 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1270 target genes. The mRNA of each one of this plurality of GAM1270 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1270 RNA, herein designated GAM RNA, and which when bound by GAM1270 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1270 target proteins.

[17658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1270 gene, herein designated GAM GENE, on one or more GAM1270 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17659] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1270 correlate with, and may be deduced from, the identity of the target genes which GAM1270 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17660] Nucleotide sequences of the GAM1270 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1270 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1270 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1270 are further described hereinbelow with reference to Table 1.

[17661] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1270 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17662] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1271 (GAM1271) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17663] GAM1271 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1271 was detected is described hereinabove with reference to Figs. 2-8.

[17664] GAM1271 gene, herein designated GAM GENE, and GAM1271 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17665] GAM1271 gene, herein designated GAM GENE, encodes a GAM1271 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1271 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1271 precursor RNA is designated SEQ ID:1248, and is provided hereinbelow with reference to the sequence listing part.

[17666] GAM1271 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17667] An enzyme complex designated DICER COMPLEX, dices the GAM1271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1271 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1271 RNA is designated SEQ ID:3849, and is provided hereinbelow with reference to the sequence listing part.

[17668] GAM1271 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1271 target RNA, herein designated GAM TARGET RNA. GAM1271 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17669] GAM1271 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1271 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1271 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1271 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1271 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17670] The complementary binding of GAM1271 RNA, herein designated GAM RNA, to target binding sites on GAM1271 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1271 target RNA, herein designated GAM TARGET RNA, into GAM1271 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17671] It is appreciated that GAM1271 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1271 target genes. The mRNA of each one of this plurality of GAM1271 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1271 RNA, herein designated GAM RNA, and which when bound by GAM1271 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1271 target proteins.

[17672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1271 gene, herein designated GAM GENE, on one or more GAM1271 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17673] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1271 correlate with, and may be deduced from, the identity of the target genes which GAM1271 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17674] Nucleotide sequences of the GAM1271 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1271 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1271 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1271 are further described hereinbelow with reference to Table 1.

[17675] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1271 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17676] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1272 (GAM1272) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17677] GAM1272 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1272 was detected is described hereinabove with reference to Figs. 2-8.

[17678] GAM1272 gene, herein designated GAM GENE, and GAM1272 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17679] GAM1272 gene, herein designated GAM GENE, encodes a GAM1272 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1272 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1272 precursor RNA is designated SEQ ID:1249, and is provided hereinbelow with reference to the sequence listing part.

[17680] GAM1272 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17681] An enzyme complex designated DICER COMPLEX, dices the GAM1272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1272 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1272 RNA is designated SEQ ID:3851, and is provided hereinbelow with reference to the sequence listing part.

[17682] GAM1272 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1272 target RNA, herein designated GAM TARGET RNA. GAM1272 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17683] GAM1272 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1272 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1272 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1272 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1272 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17684] The complementary binding of GAM1272 RNA, herein designated GAM RNA, to target binding sites on GAM1272 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1272 target RNA, herein designated GAM TARGET RNA, into GAM1272 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17685] It is appreciated that GAM1272 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1272 target genes. The

mRNA of each one of this plurality of GAM1272 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1272 RNA, herein designated GAM RNA, and which when bound by GAM1272 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1272 target proteins.

[17686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1272 gene, herein designated GAM GENE, on one or more GAM1272 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17687] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1272 correlate with, and may be deduced from, the identity of the target genes which GAM1272 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17688] Nucleotide sequences of the GAM1272 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1272 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1272 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1272 are further described hereinbelow with reference to Table 1.

[17689] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1272 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17690] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1273 (GAM1273) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17691] GAM1273 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1273 was detected is described hereinabove with reference to Figs. 2-8.

[17692] GAM1273 gene, herein designated GAM GENE, and GAM1273 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17693] GAM1273 gene, herein designated GAM GENE, encodes a GAM1273 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1273 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1273 precursor RNA is designated SEQ ID:1250, and is provided hereinbelow with reference to the sequence listing part.

[17694] GAM1273 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17695] An enzyme complex designated DICER COMPLEX, dices the GAM1273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1273 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1273 RNA is designated SEQ ID:3852, and is provided hereinbelow with reference to the sequence listing part.

[17696] GAM1273 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1273 target RNA, herein designated GAM TARGET RNA. GAM1273 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17697] GAM1273 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1273 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1273 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1273 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1273 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17698] The complementary binding of GAM1273 RNA, herein designated GAM RNA, to target binding sites on GAM1273 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1273 target RNA, herein designated GAM TARGET RNA, into GAM1273 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17699] It is appreciated that GAM1273 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1273 target genes. The mRNA of each one of this plurality of GAM1273 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1273 RNA, herein designated GAM RNA, and which when bound by GAM1273 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1273 target proteins.

[17700] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1273 gene, herein designated GAM GENE, on one or more GAM1273 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17701] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1273 correlate with, and may be deduced from, the identity of the target

genes which GAM1273 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17702] Nucleotide sequences of the GAM1273 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1273 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1273 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1273 are further described hereinbelow with reference to Table 1.

[17703] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1273 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17704] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1274 (GAM1274) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17705] GAM1274 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1274 was detected is described hereinabove with reference to Figs. 2-8.

[17706] GAM1274 gene, herein designated GAM GENE, and GAM1274 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17707] GAM1274 gene, herein designated GAM GENE, encodes a GAM1274 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1274 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1274 precursor RNA is designated SEQ ID:1251, and is provided hereinbelow with reference to the sequence listing part.

[17708] GAM1274 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17709] An enzyme complex designated DICER COMPLEX, dices the GAM1274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1274 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1274 RNA is designated SEQ ID:3853, and is provided

hereinbelow with reference to the sequence listing part.

[17710] GAM1274 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1274 target RNA, herein designated GAM TARGET RNA. GAM1274 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17711] GAM1274 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1274 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1274 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1274 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1274 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17712] The complementary binding of GAM1274 RNA, herein designated GAM RNA, to target binding sites on GAM1274 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1274 target RNA, herein designated GAM TARGET RNA, into GAM1274 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17713] It is appreciated that GAM1274 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1274 target genes. The mRNA of each one of this plurality of GAM1274 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1274 RNA, herein designated GAM RNA, and which when bound by GAM1274 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1274 target proteins.

[17714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1274 gene, herein designated GAM GENE, on one or more GAM1274 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17715] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1274 correlate with, and may be deduced from, the identity of the target genes which GAM1274 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17716] Nucleotide sequences of the GAM1274 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1274 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1274 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1274 are further described hereinbelow with reference to Table 1.

[17717] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1274 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17718] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1275 (GAM1275) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17719] GAM1275 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1275 was detected is described hereinabove with reference to Figs. 2-8.

[17720] GAM1275 gene, herein designated GAM GENE, and GAM1275 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17721] GAM1275 gene, herein designated GAM GENE, encodes a GAM1275 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1275 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1275 precursor RNA is designated SEQ ID:1252, and is provided hereinbelow with reference to the sequence listing part.

[17722] GAM1275 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17723] An enzyme complex designated DICER COMPLEX, dices the GAM1275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1275 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1275 RNA is designated SEQ ID:3854, and is provided hereinbelow with reference to the sequence listing part.

[17724] GAM1275 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1275 target RNA, herein designated GAM TARGET RNA. GAM1275 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17725] GAM1275 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1275 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1275 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1275 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1275 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17726] The complementary binding of GAM1275 RNA, herein designated GAM RNA, to target binding sites on GAM1275 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1275 target RNA, herein designated GAM TARGET RNA, into GAM1275 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17727] It is appreciated that GAM1275 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1275 target genes. The mRNA of each one of this plurality of GAM1275 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1275 RNA, herein designated GAM RNA, and which when bound by GAM1275 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1275 target proteins.

[17728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1275 gene, herein designated GAM GENE, on one or more GAM1275 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17729] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1275 correlate with, and may be deduced from, the identity of the target genes which GAM1275 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17730] Nucleotide sequences of the GAM1275 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1275 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1275 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1275 are further described hereinbelow with reference to Table 1.

[17731] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1275 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17732] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1276 (GAM1276) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17733] GAM1276 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1276 was detected is described hereinabove with reference to Figs. 2-8.

[17734] GAM1276 gene, herein designated GAM GENE, and GAM1276 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17735] GAM1276 gene, herein designated GAM GENE, encodes a GAM1276 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1276 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1276 precursor RNA is designated SEQ ID:1253, and is provided hereinbelow with reference to the sequence listing part.

[17736] GAM1276 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17737] An enzyme complex designated DICER COMPLEX, dices the GAM1276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1276 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1276 RNA is designated SEQ ID:3855, and is provided hereinbelow with reference to the sequence listing part.

[17738] GAM1276 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1276 target RNA, herein designated GAM TARGET RNA. GAM1276 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17739] GAM1276 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1276 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1276 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1276 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1276 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17740] The complementary binding of GAM1276 RNA, herein designated GAM RNA, to target binding sites on GAM1276 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1276 target RNA, herein designated GAM TARGET RNA, into GAM1276 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17741] It is appreciated that GAM1276 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1276 target genes. The mRNA of each one of this plurality of GAM1276 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1276 RNA, herein designated GAM RNA, and which when bound by GAM1276 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1276 target proteins.

[17742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1276 gene, herein designated GAM GENE, on one or more GAM1276 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17743] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1276 correlate with, and may be deduced from, the identity of the target genes which GAM1276 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17744] Nucleotide sequences of the GAM1276 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1276 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1276 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1276 are further described hereinbelow with reference to Table 1.

[17745] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1276 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17746] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1277 (GAM1277) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17747] GAM1277 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1277 was detected is described hereinabove with reference to Figs. 2-8.

[17748] GAM1277 gene, herein designated GAM GENE, and GAM1277 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17749] GAM1277 gene, herein designated GAM GENE, encodes a GAM1277 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1277 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1277 precursor RNA is designated SEQ ID:1254, and is provided hereinbelow with reference to the sequence listing part.

[17750] GAM1277 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17751] An enzyme complex designated DICER COMPLEX, dices the GAM1277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1277 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1277 RNA is designated SEQ ID:3856, and is provided hereinbelow with reference to the sequence listing part.

[17752] GAM1277 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1277 target RNA, herein designated GAM TARGET RNA. GAM1277 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17753] GAM1277 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1277 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1277 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1277 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1277 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17754] The complementary binding of GAM1277 RNA, herein designated GAM RNA, to target binding sites on GAM1277 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1277 target RNA, herein designated GAM TARGET RNA, into GAM1277 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17755] It is appreciated that GAM1277 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1277 target genes. The mRNA of each one of this plurality of GAM1277 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1277 RNA, herein designated GAM RNA, and which when bound by GAM1277 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1277 target proteins.

[17756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1277 gene, herein designated GAM GENE, on one or more GAM1277 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17757] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1277 correlate with, and may be deduced from, the identity of the target genes which GAM1277 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17758] Nucleotide sequences of the GAM1277 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1277 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1277 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1277 are further described hereinbelow with reference to Table 1.

[17759] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1277 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17760] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1278 (GAM1278) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17761] GAM1278 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1278 was detected is described hereinabove with reference to Figs. 2-8.

[17762] GAM1278 gene, herein designated GAM GENE, and GAM1278 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17763] GAM1278 gene, herein designated GAM GENE, encodes a GAM1278 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1278 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1278 precursor RNA is designated SEQ ID:1255, and is provided hereinbelow with reference to the sequence listing part.

[17764] GAM1278 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17765] An enzyme complex designated DICER COMPLEX, dices the GAM1278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1278 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1278 RNA is designated SEQ ID:3857, and is provided hereinbelow with reference to the sequence listing part.

[17766] GAM1278 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1278 target RNA, herein designated GAM TARGET RNA. GAM1278 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17767] GAM1278 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1278 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1278 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1278 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1278 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17768] The complementary binding of GAM1278 RNA, herein designated GAM RNA, to target binding sites on GAM1278 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1278 target RNA, herein designated GAM TARGET RNA, into GAM1278 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17769] It is appreciated that GAM1278 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1278 target genes. The

mRNA of each one of this plurality of GAM1278 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1278 RNA, herein designated GAM RNA, and which when bound by GAM1278 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1278 target proteins.

[17770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1278 gene, herein designated GAM GENE, on one or more GAM1278 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17771] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1278 correlate with, and may be deduced from, the identity of the target genes which GAM1278 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17772] Nucleotide sequences of the GAM1278 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1278 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1278 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1278 are further described hereinbelow with reference to Table 1.

[17773] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1278 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17774] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1279 (GAM1279) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17775] GAM1279 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1279 was detected is described hereinabove with reference to Figs. 2-8.

[17776] GAM1279 gene, herein designated GAM GENE, and GAM1279 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17777] GAM1279 gene, herein designated GAM GENE, encodes a GAM1279 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1279 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1279 precursor RNA is designated SEQ ID:1256, and is provided hereinbelow with reference to the sequence listing part.

[17778] GAM1279 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17779] An enzyme complex designated DICER COMPLEX, dices the GAM1279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1279 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1279 RNA is designated SEQ ID:3858, and is provided hereinbelow with reference to the sequence listing part.

[17780] GAM1279 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1279 target RNA, herein designated GAM TARGET RNA. GAM1279 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17781] GAM1279 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1279 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1279 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1279 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1279 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17782] The complementary binding of GAM1279 RNA, herein designated GAM RNA, to target binding sites on GAM1279 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1279 target RNA, herein designated GAM TARGET RNA, into GAM1279 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17783] It is appreciated that GAM1279 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1279 target genes. The mRNA of each one of this plurality of GAM1279 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1279 RNA, herein designated GAM RNA, and which when bound by GAM1279 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1279 target proteins.

[17784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1279 gene, herein designated GAM GENE, on one or more GAM1279 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17785] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1279 correlate with, and may be deduced from, the identity of the target

genes which GAM1279 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17786] Nucleotide sequences of the GAM1279 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1279 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1279 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1279 are further described hereinbelow with reference to Table 1.

[17787] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1279 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17788] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1280 (GAM1280) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17789] GAM1280 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1280 was detected is described hereinabove with reference to Figs. 2-8.

[17790] GAM1280 gene, herein designated GAM GENE, and GAM1280 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17791] GAM1280 gene, herein designated GAM GENE, encodes a GAM1280 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1280 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1280 precursor RNA is designated SEQ ID:1257, and is provided hereinbelow with reference to the sequence listing part.

[17792] GAM1280 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1280 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17793] An enzyme complex designated DICER COMPLEX, dices the GAM1280 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1280 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1280 RNA is designated SEQ ID:3859, and is provided

hereinbelow with reference to the sequence listing part.

[17794] GAM1280 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1280 target RNA, herein designated GAM TARGET RNA. GAM1280 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17795] GAM1280 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1280 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1280 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1280 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1280 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17796] The complementary binding of GAM1280 RNA, herein designated GAM RNA, to target binding sites on GAM1280 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1280 target RNA, herein designated GAM TARGET RNA, into GAM1280 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17797] It is appreciated that GAM1280 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1280 target genes. The mRNA of each one of this plurality of GAM1280 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1280 RNA, herein designated GAM RNA, and which when bound by GAM1280 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1280 target proteins.

[17798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1280 gene, herein designated GAM GENE, on one or more GAM1280 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17799] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1280 correlate with, and may be deduced from, the identity of the target genes which GAM1280 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17800] Nucleotide sequences of the GAM1280 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1280 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1280 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1280 are further described hereinbelow with reference to Table 1.

[17801] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1280 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17802] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1281 (GAM1281) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17803] GAM1281 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1281 was detected is described hereinabove with reference to Figs. 2-8.

[17804] GAM1281 gene, herein designated GAM GENE, and GAM1281 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17805] GAM1281 gene, herein designated GAM GENE, encodes a GAM1281 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1281 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1281 precursor RNA is designated SEQ ID:1258, and is provided hereinbelow with reference to the sequence listing part.

[17806] GAM1281 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17807] An enzyme complex designated DICER COMPLEX, dices the GAM1281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1281 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1281 RNA is designated SEQ ID:3861, and is provided hereinbelow with reference to the sequence listing part.

[17808] GAM1281 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1281 target RNA, herein designated GAM TARGET RNA. GAM1281 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17809] GAM1281 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1281 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1281 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1281 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1281 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17810] The complementary binding of GAM1281 RNA, herein designated GAM RNA, to target binding sites on GAM1281 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1281 target RNA, herein designated GAM TARGET RNA, into GAM1281 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17811] It is appreciated that GAM1281 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1281 target genes. The mRNA of each one of this plurality of GAM1281 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1281 RNA, herein designated GAM RNA, and which when bound by GAM1281 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1281 target proteins.

[17812] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1281 gene, herein designated GAM GENE, on one or more GAM1281 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17813] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1281 correlate with, and may be deduced from, the identity of the target genes which GAM1281 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17814] Nucleotide sequences of the GAM1281 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1281 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1281 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1281 are further described hereinbelow with reference to Table 1.

[17815] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1281 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17816] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1282 (GAM1282) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17817] GAM1282 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1282 was detected is described hereinabove with reference to Figs. 2-8.

[17818] GAM1282 gene, herein designated GAM GENE, and GAM1282 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17819] GAM1282 gene, herein designated GAM GENE, encodes a GAM1282 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1282 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1282 precursor RNA is designated SEQ ID:1259, and is provided hereinbelow with reference to the sequence listing part.

[17820] GAM1282 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17821] An enzyme complex designated DICER COMPLEX, dices the GAM1282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1282 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1282 RNA is designated SEQ ID:3860, and is provided hereinbelow with reference to the sequence listing part.

[17822] GAM1282 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1282 target RNA, herein designated GAM TARGET RNA. GAM1282 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17823] GAM1282 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1282 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1282 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1282 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1282 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17824] The complementary binding of GAM1282 RNA, herein designated GAM RNA, to target binding sites on GAM1282 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1282 target RNA, herein designated GAM TARGET RNA, into GAM1282 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17825] It is appreciated that GAM1282 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1282 target genes. The mRNA of each one of this plurality of GAM1282 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1282 RNA, herein designated GAM RNA, and which when bound by GAM1282 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1282 target proteins.

[17826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1282 gene, herein designated GAM GENE, on one or more GAM1282 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17827] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1282 correlate with, and may be deduced from, the identity of the target genes which GAM1282 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17828] Nucleotide sequences of the GAM1282 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1282 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1282 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1282 are further described hereinbelow with reference to Table 1.

[17829] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1282 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17830] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1283 (GAM1283) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17831] GAM1283 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1283 was detected is described hereinabove with reference to Figs. 2-8.

[17832] GAM1283 gene, herein designated GAM GENE, and GAM1283 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17833] GAM1283 gene, herein designated GAM GENE, encodes a GAM1283 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1283 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1283 precursor RNA is designated SEQ ID:1260, and is provided hereinbelow with reference to the sequence listing part.

[17834] GAM1283 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17835] An enzyme complex designated DICER COMPLEX, dices the GAM1283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1283 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1283 RNA is designated SEQ ID:3862, and is provided hereinbelow with reference to the sequence listing part.

[17836] GAM1283 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1283 target RNA, herein designated GAM TARGET RNA. GAM1283 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17837] GAM1283 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1283 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1283 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1283 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1283 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17838] The complementary binding of GAM1283 RNA, herein designated GAM RNA, to target binding sites on GAM1283 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1283 target RNA, herein designated GAM TARGET RNA, into GAM1283 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17839] It is appreciated that GAM1283 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1283 target genes. The mRNA of each one of this plurality of GAM1283 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1283 RNA, herein designated GAM RNA, and which when bound by GAM1283 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1283 target proteins.

[17840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1283 gene, herein designated GAM GENE, on one or more GAM1283 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17841] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1283 correlate with, and may be deduced from, the identity of the target genes which GAM1283 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17842] Nucleotide sequences of the GAM1283 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1283 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1283 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1283 are further described hereinbelow with reference to Table 1.

[17843] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1283 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17844] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1284 (GAM1284) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17845] GAM1284 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1284 was detected is described hereinabove with reference to Figs. 2-8.

[17846] GAM1284 gene, herein designated GAM GENE, and GAM1284 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17847] GAM1284 gene, herein designated GAM GENE, encodes a GAM1284 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1284 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1284 precursor RNA is designated SEQ ID:1261, and is provided hereinbelow with reference to the sequence listing part.

[17848] GAM1284 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17849] An enzyme complex designated DICER COMPLEX, dices the GAM1284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1284 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1284 RNA is designated SEQ ID:3863, and is provided hereinbelow with reference to the sequence listing part.

[17850] GAM1284 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1284 target RNA, herein designated GAM TARGET RNA. GAM1284 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17851] GAM1284 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1284 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1284 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1284 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1284 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17852] The complementary binding of GAM1284 RNA, herein designated GAM RNA, to target binding sites on GAM1284 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1284 target RNA, herein designated GAM TARGET RNA, into GAM1284 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17853] It is appreciated that GAM1284 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1284 target genes. The

mRNA of each one of this plurality of GAM1284 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1284 RNA, herein designated GAM RNA, and which when bound by GAM1284 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1284 target proteins.

[17854] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1284 gene, herein designated GAM GENE, on one or more GAM1284 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17855] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1284 correlate with, and may be deduced from, the identity of the target genes which GAM1284 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17856] Nucleotide sequences of the GAM1284 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1284 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1284 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1284 are further described hereinbelow with reference to Table 1.

[17857] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1284 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17858] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1285 (GAM1285) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17859] GAM1285 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1285 was detected is described hereinabove with reference to Figs. 2-8.

[17860] GAM1285 gene, herein designated GAM GENE, and GAM1285 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17861] GAM1285 gene, herein designated GAM GENE, encodes a GAM1285 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1285 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1285 precursor RNA is designated SEQ ID:1262, and is provided hereinbelow with reference to the sequence listing part.

[17862] GAM1285 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17863] An enzyme complex designated DICER COMPLEX, dices the GAM1285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1285 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1285 RNA is designated SEQ ID:3864, and is provided hereinbelow with reference to the sequence listing part.

[17864] GAM1285 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1285 target RNA, herein designated GAM TARGET RNA. GAM1285 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17865] GAM1285 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1285 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1285 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1285 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1285 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17866] The complementary binding of GAM1285 RNA, herein designated GAM RNA, to target binding sites on GAM1285 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1285 target RNA, herein designated GAM TARGET RNA, into GAM1285 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17867] It is appreciated that GAM1285 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1285 target genes. The mRNA of each one of this plurality of GAM1285 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1285 RNA, herein designated GAM RNA, and which when bound by GAM1285 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1285 target proteins.

[17868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1285 gene, herein designated GAM GENE, on one or more GAM1285 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17869] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1285 correlate with, and may be deduced from, the identity of the target

genes which GAM1285 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17870] Nucleotide sequences of the GAM1285 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1285 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1285 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1285 are further described hereinbelow with reference to Table 1.

[17871] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1285 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17872] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1286 (GAM1286) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17873] GAM1286 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1286 was detected is described hereinabove with reference to Figs. 2-8.

[17874] GAM1286 gene, herein designated GAM GENE, and GAM1286 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17875] GAM1286 gene, herein designated GAM GENE, encodes a GAM1286 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1286 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1286 precursor RNA is designated SEQ ID:1263, and is provided hereinbelow with reference to the sequence listing part.

[17876] GAM1286 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17877] An enzyme complex designated DICER COMPLEX, dices the GAM1286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1286 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1286 RNA is designated SEQ ID:3865, and is provided

hereinbelow with reference to the sequence listing part.

[17878] GAM1286 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1286 target RNA, herein designated GAM TARGET RNA. GAM1286 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17879] GAM1286 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1286 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1286 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1286 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1286 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17880] The complementary binding of GAM1286 RNA, herein designated GAM RNA, to target binding sites on GAM1286 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1286 target RNA, herein designated GAM TARGET RNA, into GAM1286 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17881] It is appreciated that GAM1286 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1286 target genes. The mRNA of each one of this plurality of GAM1286 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1286 RNA, herein designated GAM RNA, and which when bound by GAM1286 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1286 target proteins.

[17882] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1286 gene, herein designated GAM GENE, on one or more GAM1286 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17883] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1286 correlate with, and may be deduced from, the identity of the target genes which GAM1286 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17884] Nucleotide sequences of the GAM1286 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1286 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1286 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1286 are further described hereinbelow with reference to Table 1.

[17885] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1286 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17886] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1287 (GAM1287) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17887] GAM1287 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1287 was detected is described hereinabove with reference to Figs. 2-8.

[17888] GAM1287 gene, herein designated GAM GENE, and GAM1287 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17889] GAM1287 gene, herein designated GAM GENE, encodes a GAM1287 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1287 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1287 precursor RNA is designated SEQ ID:1264, and is provided hereinbelow with reference to the sequence listing part.

[17890] GAM1287 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1287 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17891] An enzyme complex designated DICER COMPLEX, dices the GAM1287 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1287 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1287 RNA is designated SEQ ID:3866, and is provided hereinbelow with reference to the sequence listing part.

[17892] GAM1287 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1287 target RNA, herein designated GAM TARGET RNA. GAM1287 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17893] GAM1287 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1287 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1287 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1287 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1287 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17894] The complementary binding of GAM1287 RNA, herein designated GAM RNA, to target binding sites on GAM1287 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1287 target RNA, herein designated GAM TARGET RNA, into GAM1287 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17895] It is appreciated that GAM1287 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1287 target genes. The mRNA of each one of this plurality of GAM1287 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1287 RNA, herein designated GAM RNA, and which when bound by GAM1287 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1287 target proteins.

[17896] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1287 gene, herein designated GAM GENE, on one or more GAM1287 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17897] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1287 correlate with, and may be deduced from, the identity of the target genes which GAM1287 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17898] Nucleotide sequences of the GAM1287 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1287 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1287 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1287 are further described hereinbelow with reference to Table 1.

[17899] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1287 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17900] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1288 (GAM1288) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17901] GAM1288 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1288 was detected is described hereinabove with reference to Figs. 2-8.

[17902] GAM1288 gene, herein designated GAM GENE, and GAM1288 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17903] GAM1288 gene, herein designated GAM GENE, encodes a GAM1288 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1288 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1288 precursor RNA is designated SEQ ID:1265, and is provided hereinbelow with reference to the sequence listing part.

[17904] GAM1288 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17905] An enzyme complex designated DICER COMPLEX, dices the GAM1288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1288 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1288 RNA is designated SEQ ID:3867, and is provided hereinbelow with reference to the sequence listing part.

[17906] GAM1288 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1288 target RNA, herein designated GAM TARGET RNA. GAM1288 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17907] GAM1288 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1288 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1288 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1288 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1288 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17908] The complementary binding of GAM1288 RNA, herein designated GAM RNA, to target binding sites on GAM1288 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1288 target RNA, herein designated GAM TARGET RNA, into GAM1288 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17909] It is appreciated that GAM1288 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1288 target genes. The mRNA of each one of this plurality of GAM1288 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1288 RNA, herein designated GAM RNA, and which when bound by GAM1288 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1288 target proteins.

[17910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1288 gene, herein designated GAM GENE, on one or more GAM1288 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17911] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1288 correlate with, and may be deduced from, the identity of the target genes which GAM1288 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17912] Nucleotide sequences of the GAM1288 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1288 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1288 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1288 are further described hereinbelow with reference to Table 1.

[17913] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1288 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17914] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1289 (GAM1289) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17915] GAM1289 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1289 was detected is described hereinabove with reference to Figs. 2-8.

[17916] GAM1289 gene, herein designated GAM GENE, and GAM1289 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17917] GAM1289 gene, herein designated GAM GENE, encodes a GAM1289 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1289 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1289 precursor RNA is designated SEQ ID:1266, and is provided hereinbelow with reference to the sequence listing part.

[17918] GAM1289 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17919] An enzyme complex designated DICER COMPLEX, dices the GAM1289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1289 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1289 RNA is designated SEQ ID:3868, and is provided hereinbelow with reference to the sequence listing part.

[17920] GAM1289 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1289 target RNA, herein designated GAM TARGET RNA. GAM1289 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17921] GAM1289 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1289 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1289 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1289 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1289 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17922] The complementary binding of GAM1289 RNA, herein designated GAM RNA, to target binding sites on GAM1289 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1289 target RNA, herein designated GAM TARGET RNA, into GAM1289 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17923] It is appreciated that GAM1289 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1289 target genes. The mRNA of each one of this plurality of GAM1289 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1289 RNA, herein designated GAM RNA, and which when bound by GAM1289 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1289 target proteins.

[17924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1289 gene, herein designated GAM GENE, on one or more GAM1289 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17925] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1289 correlate with, and may be deduced from, the identity of the target genes which GAM1289 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17926] Nucleotide sequences of the GAM1289 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1289 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1289 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1289 are further described hereinbelow with reference to Table 1.

[17927] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1289 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17928] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1290 (GAM1290) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17929] GAM1290 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1290 was detected is described hereinabove with reference to Figs. 2-8.

[17930] GAM1290 gene, herein designated GAM GENE, and GAM1290 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17931] GAM1290 gene, herein designated GAM GENE, encodes a GAM1290 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1290 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1290 precursor RNA is designated SEQ ID:1267, and is provided hereinbelow with reference to the sequence listing part.

[17932] GAM1290 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17933] An enzyme complex designated DICER COMPLEX, dices the GAM1290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1290 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1290 RNA is designated SEQ ID:3869, and is provided hereinbelow with reference to the sequence listing part.

[17934] GAM1290 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1290 target RNA, herein designated GAM TARGET RNA. GAM1290 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17935] GAM1290 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1290 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1290 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1290 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1290 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17936] The complementary binding of GAM1290 RNA, herein designated GAM RNA, to target binding sites on GAM1290 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1290 target RNA, herein designated GAM TARGET RNA, into GAM1290 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17937] It is appreciated that GAM1290 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1290 target genes. The

mRNA of each one of this plurality of GAM1290 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1290 RNA, herein designated GAM RNA, and which when bound by GAM1290 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1290 target proteins.

[17938] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1290 gene, herein designated GAM GENE, on one or more GAM1290 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17939] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1290 correlate with, and may be deduced from, the identity of the target genes which GAM1290 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17940] Nucleotide sequences of the GAM1290 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1290 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1290 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1290 are further described hereinbelow with reference to Table 1.

[17941] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1290 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17942] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1291 (GAM1291) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17943] GAM1291 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1291 was detected is described hereinabove with reference to Figs. 2-8.

[17944] GAM1291 gene, herein designated GAM GENE, and GAM1291 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17945] GAM1291 gene, herein designated GAM GENE, encodes a GAM1291 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1291 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1291 precursor RNA is designated SEQ ID:1268, and is provided hereinbelow with reference to the sequence listing part.

[17946] GAM1291 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17947] An enzyme complex designated DICER COMPLEX, dices the GAM1291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1291 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1291 RNA is designated SEQ ID:3870, and is provided hereinbelow with reference to the sequence listing part.

[17948] GAM1291 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1291 target RNA, herein designated GAM TARGET RNA. GAM1291 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17949] GAM1291 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1291 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1291 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1291 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1291 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17950] The complementary binding of GAM1291 RNA, herein designated GAM RNA, to target binding sites on GAM1291 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1291 target RNA, herein designated GAM TARGET RNA, into GAM1291 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17951] It is appreciated that GAM1291 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1291 target genes. The mRNA of each one of this plurality of GAM1291 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1291 RNA, herein designated GAM RNA, and which when bound by GAM1291 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1291 target proteins.

[17952] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1291 gene, herein designated GAM GENE, on one or more GAM1291 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17953] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1291 correlate with, and may be deduced from, the identity of the target

genes which GAM1291 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17954] Nucleotide sequences of the GAM1291 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1291 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1291 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1291 are further described hereinbelow with reference to Table 1.

[17955] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1291 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17956] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1292 (GAM1292) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17957] GAM1292 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1292 was detected is described hereinabove with reference to Figs. 2-8.

[17958] GAM1292 gene, herein designated GAM GENE, and GAM1292 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[17959] GAM1292 gene, herein designated GAM GENE, encodes a GAM1292 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1292 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1292 precursor RNA is designated SEQ ID:1269, and is provided hereinbelow with reference to the sequence listing part.

[17960] GAM1292 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17961] An enzyme complex designated DICER COMPLEX, dices the GAM1292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1292 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1292 RNA is designated SEQ ID:3871, and is provided

hereinbelow with reference to the sequence listing part.

[17962] GAM1292 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1292 target RNA, herein designated GAM TARGET RNA. GAM1292 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17963] GAM1292 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1292 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1292 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1292 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1292 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17964] The complementary binding of GAM1292 RNA, herein designated GAM RNA, to target binding sites on GAM1292 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1292 target RNA, herein designated GAM TARGET RNA, into GAM1292 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17965] It is appreciated that GAM1292 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1292 target genes. The mRNA of each one of this plurality of GAM1292 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1292 RNA, herein designated GAM RNA, and which when bound by GAM1292 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1292 target proteins.

[17966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1292 gene, herein designated GAM GENE, on one or more GAM1292 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17967] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1292 correlate with, and may be deduced from, the identity of the target genes which GAM1292 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17968] Nucleotide sequences of the GAM1292 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1292 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1292 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1292 are further described hereinbelow with reference to Table 1.

[17969] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1292 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17970] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1293 (GAM1293) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17971] GAM1293 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1293 was detected is described hereinabove with reference to Figs. 2-8.

[17972] GAM1293 gene, herein designated GAM GENE, and GAM1293 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17973] GAM1293 gene, herein designated GAM GENE, encodes a GAM1293 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1293 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1293 precursor RNA is designated SEQ ID:1270, and is provided hereinbelow with reference to the sequence listing part.

[17974] GAM1293 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17975] An enzyme complex designated DICER COMPLEX, dices the GAM1293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1293 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1293 RNA is designated SEQ ID:3872, and is provided hereinbelow with reference to the sequence listing part.

[17976] GAM1293 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1293 target RNA, herein designated GAM TARGET RNA. GAM1293 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17977] GAM1293 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1293 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1293 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1293 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1293 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17978] The complementary binding of GAM1293 RNA, herein designated GAM RNA, to target binding sites on GAM1293 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1293 target RNA, herein designated GAM TARGET RNA, into GAM1293 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17979] It is appreciated that GAM1293 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1293 target genes. The mRNA of each one of this plurality of GAM1293 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1293 RNA, herein designated GAM RNA, and which when bound by GAM1293 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1293 target proteins.

[17980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1293 gene, herein designated GAM GENE, on one or more GAM1293 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17981] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1293 correlate with, and may be deduced from, the identity of the target genes which GAM1293 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17982] Nucleotide sequences of the GAM1293 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1293 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1293 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1293 are further described hereinbelow with reference to Table 1.

[17983] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1293 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[17984] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1294 (GAM1294) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17985] GAM1294 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1294 was detected is described hereinabove with reference to Figs. 2-8.

[17986] GAM1294 gene, herein designated GAM GENE, and GAM1294 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[17987] GAM1294 gene, herein designated GAM GENE, encodes a GAM1294 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1294 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1294 precursor RNA is designated SEQ ID:1271, and is provided hereinbelow with reference to the sequence listing part.

[17988] GAM1294 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17989] An enzyme complex designated DICER COMPLEX, dices the GAM1294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1294 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1294 RNA is designated SEQ ID:3873, and is provided hereinbelow with reference to the sequence listing part.

[17990] GAM1294 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1294 target RNA, herein designated GAM TARGET RNA. GAM1294 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17991] GAM1294 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1294 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1294 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1294 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1294 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17992] The complementary binding of GAM1294 RNA, herein designated GAM RNA, to target binding sites on GAM1294 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1294 target RNA, herein designated GAM TARGET RNA, into GAM1294 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[17993] It is appreciated that GAM1294 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1294 target genes. The mRNA of each one of this plurality of GAM1294 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1294 RNA, herein designated GAM RNA, and which when bound by GAM1294 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1294 target proteins.

[17994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1294 gene, herein designated GAM GENE, on one or more GAM1294 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17995] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1294 correlate with, and may be deduced from, the identity of the target genes which GAM1294 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17996] Nucleotide sequences of the GAM1294 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1294 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1294 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1294 are further described hereinbelow with reference to Table 1.

[17997] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1294 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[17998] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1295 (GAM1295) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[17999] GAM1295 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1295 was detected is described hereinabove with reference to Figs. 2-8.

[18000] GAM1295 gene, herein designated GAM GENE, and GAM1295 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18001] GAM1295 gene, herein designated GAM GENE, encodes a GAM1295 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1295 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1295 precursor RNA is designated SEQ ID:1272, and is provided hereinbelow with reference to the sequence listing part.

[18002] GAM1295 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18003] An enzyme complex designated DICER COMPLEX, dices the GAM1295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1295 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1295 RNA is designated SEQ ID:3874, and is provided hereinbelow with reference to the sequence listing part.

[18004] GAM1295 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1295 target RNA, herein designated GAM TARGET RNA. GAM1295 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18005] GAM1295 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1295 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1295 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1295 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1295 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18006] The complementary binding of GAM1295 RNA, herein designated GAM RNA, to target binding sites on GAM1295 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1295 target RNA, herein designated GAM TARGET RNA, into GAM1295 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18007] It is appreciated that GAM1295 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1295 target genes. The mRNA of each one of this plurality of GAM1295 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1295 RNA, herein designated GAM RNA, and which when bound by GAM1295 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1295 target proteins.

[18008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1295 gene, herein designated GAM GENE, on one or more GAM1295 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18009] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1295 correlate with, and may be deduced from, the identity of the target genes which GAM1295 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18010] Nucleotide sequences of the GAM1295 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1295 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1295 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1295 are further described hereinbelow with reference to Table 1.

[18011] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1295 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18012] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1296 (GAM1296) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18013] GAM1296 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1296 was detected is described hereinabove with reference to Figs. 2-8.

[18014] GAM1296 gene, herein designated GAM GENE, and GAM1296 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18015] GAM1296 gene, herein designated GAM GENE, encodes a GAM1296 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1296 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1296 precursor RNA is designated SEQ ID:1273, and is provided hereinbelow with reference to the sequence listing part.

[18016] GAM1296 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18017] An enzyme complex designated DICER COMPLEX, dices the GAM1296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1296 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1296 RNA is designated SEQ ID:3875, and is provided hereinbelow with reference to the sequence listing part.

[18018] GAM1296 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1296 target RNA, herein designated GAM TARGET RNA. GAM1296 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18019] GAM1296 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1296 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1296 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1296 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1296 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18020] The complementary binding of GAM1296 RNA, herein designated GAM RNA, to target binding sites on GAM1296 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1296 target RNA, herein designated GAM TARGET RNA, into GAM1296 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18021] It is appreciated that GAM1296 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1296 target genes. The

mRNA of each one of this plurality of GAM1296 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1296 RNA, herein designated GAM RNA, and which when bound by GAM1296 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1296 target proteins.

[18022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1296 gene, herein designated GAM GENE, on one or more GAM1296 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18023] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1296 correlate with, and may be deduced from, the identity of the target genes which GAM1296 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18024] Nucleotide sequences of the GAM1296 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1296 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1296 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1296 are further described hereinbelow with reference to Table 1.

[18025] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1296 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18026] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1297 (GAM1297) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18027] GAM1297 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1297 was detected is described hereinabove with reference to Figs. 2-8.

[18028] GAM1297 gene, herein designated GAM GENE, and GAM1297 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18029] GAM1297 gene, herein designated GAM GENE, encodes a GAM1297 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1297 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1297 precursor RNA is designated SEQ ID:1274, and is provided hereinbelow with reference to the sequence listing part.

[18030] GAM1297 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18031] An enzyme complex designated DICER COMPLEX, dices the GAM1297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1297 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1297 RNA is designated SEQ ID:3876, and is provided hereinbelow with reference to the sequence listing part.

[18032] GAM1297 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1297 target RNA, herein designated GAM TARGET RNA. GAM1297 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18033] GAM1297 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1297 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1297 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1297 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1297 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18034] The complementary binding of GAM1297 RNA, herein designated GAM RNA, to target binding sites on GAM1297 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1297 target RNA, herein designated GAM TARGET RNA, into GAM1297 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18035] It is appreciated that GAM1297 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1297 target genes. The mRNA of each one of this plurality of GAM1297 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1297 RNA, herein designated GAM RNA, and which when bound by GAM1297 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1297 target proteins.

[18036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1297 gene, herein designated GAM GENE, on one or more GAM1297 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18037] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1297 correlate with, and may be deduced from, the identity of the target

genes which GAM1297 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18038] Nucleotide sequences of the GAM1297 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1297 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1297 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1297 are further described hereinbelow with reference to Table 1.

[18039] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1297 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18040] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1298 (GAM1298) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18041] GAM1298 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1298 was detected is described hereinabove with reference to Figs. 2-8.

[18042] GAM1298 gene, herein designated GAM GENE, and GAM1298 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18043] GAM1298 gene, herein designated GAM GENE, encodes a GAM1298 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1298 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1298 precursor RNA is designated SEQ ID:1275, and is provided hereinbelow with reference to the sequence listing part.

[18044] GAM1298 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18045] An enzyme complex designated DICER COMPLEX, dices the GAM1298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1298 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1298 RNA is designated SEQ ID:3877, and is provided

hereinbelow with reference to the sequence listing part.

[18046] GAM1298 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1298 target RNA, herein designated GAM TARGET RNA. GAM1298 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18047] GAM1298 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1298 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1298 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1298 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1298 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18048] The complementary binding of GAM1298 RNA, herein designated GAM RNA, to target binding sites on GAM1298 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1298 target RNA, herein designated GAM TARGET RNA, into GAM1298 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18049] It is appreciated that GAM1298 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1298 target genes. The mRNA of each one of this plurality of GAM1298 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1298 RNA, herein designated GAM RNA, and which when bound by GAM1298 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1298 target proteins.

[18050] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1298 gene, herein designated GAM GENE, on one or more GAM1298 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18051] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1298 correlate with, and may be deduced from, the identity of the target genes which GAM1298 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18052] Nucleotide sequences of the GAM1298 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1298 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1298 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1298 are further described hereinbelow with reference to Table 1.

[18053] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1298 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18054] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1299 (GAM1299) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18055] GAM1299 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1299 was detected is described hereinabove with reference to Figs. 2-8.

[18056] GAM1299 gene, herein designated GAM GENE, and GAM1299 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18057] GAM1299 gene, herein designated GAM GENE, encodes a GAM1299 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1299 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1299 precursor RNA is designated SEQ ID:1276, and is provided hereinbelow with reference to the sequence listing part.

[18058] GAM1299 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18059] An enzyme complex designated DICER COMPLEX, dices the GAM1299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1299 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1299 RNA is designated SEQ ID:3878, and is provided hereinbelow with reference to the sequence listing part.

[18060] GAM1299 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1299 target RNA, herein designated GAM TARGET RNA. GAM1299 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18061] GAM1299 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1299 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1299 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1299 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1299 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18062] The complementary binding of GAM1299 RNA, herein designated GAM RNA, to target binding sites on GAM1299 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1299 target RNA, herein designated GAM TARGET RNA, into GAM1299 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18063] It is appreciated that GAM1299 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1299 target genes. The mRNA of each one of this plurality of GAM1299 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1299 RNA, herein designated GAM RNA, and which when bound by GAM1299 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1299 target proteins.

[18064] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1299 gene, herein designated GAM GENE, on one or more GAM1299 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18065] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1299 correlate with, and may be deduced from, the identity of the target genes which GAM1299 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18066] Nucleotide sequences of the GAM1299 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1299 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1299 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1299 are further described hereinbelow with reference to Table 1.

[18067] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1299 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18068] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1300 (GAM1300) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18069] GAM1300 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1300 was detected is described hereinabove with reference to Figs. 2-8.

[18070] GAM1300 gene, herein designated GAM GENE, and GAM1300 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18071] GAM1300 gene, herein designated GAM GENE, encodes a GAM1300 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1300 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1300 precursor RNA is designated SEQ ID:1277, and is provided hereinbelow with reference to the sequence listing part.

[18072] GAM1300 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18073] An enzyme complex designated DICER COMPLEX, dices the GAM1300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1300 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1300 RNA is designated SEQ ID:3881, and is provided hereinbelow with reference to the sequence listing part.

[18074] GAM1300 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1300 target RNA, herein designated GAM TARGET RNA. GAM1300 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18075] GAM1300 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1300 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1300 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1300 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1300 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18076] The complementary binding of GAM1300 RNA, herein designated GAM RNA, to target binding sites on GAM1300 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1300 target RNA, herein designated GAM TARGET RNA, into GAM1300 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18077] It is appreciated that GAM1300 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1300 target genes. The mRNA of each one of this plurality of GAM1300 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1300 RNA, herein designated GAM RNA, and which when bound by GAM1300 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1300 target proteins.

[18078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1300 gene, herein designated GAM GENE, on one or more GAM1300 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18079] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1300 correlate with, and may be deduced from, the identity of the target genes which GAM1300 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18080] Nucleotide sequences of the GAM1300 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1300 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1300 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1300 are further described hereinbelow with reference to Table 1.

[18081] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1300 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18082] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1301 (GAM1301) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18083] GAM1301 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1301 was detected is described hereinabove with reference to Figs. 2-8.

[18084] GAM1301 gene, herein designated GAM GENE, and GAM1301 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18085] GAM1301 gene, herein designated GAM GENE, encodes a GAM1301 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1301 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1301 precursor RNA is designated SEQ ID:1278, and is provided hereinbelow with reference to the sequence listing part.

[18086] GAM1301 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18087] An enzyme complex designated DICER COMPLEX, dices the GAM1301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1301 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1301 RNA is designated SEQ ID:3883, and is provided hereinbelow with reference to the sequence listing part.

[18088] GAM1301 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1301 target RNA, herein designated GAM TARGET RNA. GAM1301 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18089] GAM1301 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1301 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1301 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1301 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1301 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18090] The complementary binding of GAM1301 RNA, herein designated GAM RNA, to target binding sites on GAM1301 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1301 target RNA, herein designated GAM TARGET RNA, into GAM1301 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18091] It is appreciated that GAM1301 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1301 target genes. The mRNA of each one of this plurality of GAM1301 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1301 RNA, herein designated GAM RNA, and which when bound by GAM1301 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1301 target proteins.

[18092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1301 gene, herein designated GAM GENE, on one or more GAM1301 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18093] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1301 correlate with, and may be deduced from, the identity of the target genes which GAM1301 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18094] Nucleotide sequences of the GAM1301 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1301 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1301 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1301 are further described hereinbelow with reference to Table 1.

[18095] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1301 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18096] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1302 (GAM1302) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18097] GAM1302 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1302 was detected is described hereinabove with reference to Figs. 2-8.

[18098] GAM1302 gene, herein designated GAM GENE, and GAM1302 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18099] GAM1302 gene, herein designated GAM GENE, encodes a GAM1302 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1302 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1302 precursor RNA is designated SEQ ID:1279, and is provided hereinbelow with reference to the sequence listing part.

[18100] GAM1302 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18101] An enzyme complex designated DICER COMPLEX, dices the GAM1302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1302 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1302 RNA is designated SEQ ID:3884, and is provided hereinbelow with reference to the sequence listing part.

[18102] GAM1302 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1302 target RNA, herein designated GAM TARGET RNA. GAM1302 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18103] GAM1302 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1302 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1302 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1302 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1302 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18104] The complementary binding of GAM1302 RNA, herein designated GAM RNA, to target binding sites on GAM1302 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1302 target RNA, herein designated GAM TARGET RNA, into GAM1302 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18105] It is appreciated that GAM1302 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1302 target genes. The

mRNA of each one of this plurality of GAM1302 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1302 RNA, herein designated GAM RNA, and which when bound by GAM1302 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1302 target proteins.

[18106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1302 gene, herein designated GAM GENE, on one or more GAM1302 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18107] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1302 correlate with, and may be deduced from, the identity of the target genes which GAM1302 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18108] Nucleotide sequences of the GAM1302 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1302 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1302 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1302 are further described hereinbelow with reference to Table 1.

[18109] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1302 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18110] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1303 (GAM1303) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18111] GAM1303 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1303 was detected is described hereinabove with reference to Figs. 2-8.

[18112] GAM1303 gene, herein designated GAM GENE, and GAM1303 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18113] GAM1303 gene, herein designated GAM GENE, encodes a GAM1303 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1303 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1303 precursor RNA is designated SEQ ID:1280, and is provided hereinbelow with reference to the sequence listing part.

[18114] GAM1303 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18115] An enzyme complex designated DICER COMPLEX, dices the GAM1303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1303 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1303 RNA is designated SEQ ID:3885, and is provided hereinbelow with reference to the sequence listing part.

[18116] GAM1303 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1303 target RNA, herein designated GAM TARGET RNA. GAM1303 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18117] GAM1303 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1303 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1303 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1303 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1303 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18118] The complementary binding of GAM1303 RNA, herein designated GAM RNA, to target binding sites on GAM1303 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1303 target RNA, herein designated GAM TARGET RNA, into GAM1303 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18119] It is appreciated that GAM1303 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1303 target genes. The mRNA of each one of this plurality of GAM1303 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1303 RNA, herein designated GAM RNA, and which when bound by GAM1303 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1303 target proteins.

[18120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1303 gene, herein designated GAM GENE, on one or more GAM1303 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18121] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1303 correlate with, and may be deduced from, the identity of the target

genes which GAM1303 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18122] Nucleotide sequences of the GAM1303 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1303 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1303 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1303 are further described hereinbelow with reference to Table 1.

[18123] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1303 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18124] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1304 (GAM1304) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18125] GAM1304 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1304 was detected is described hereinabove with reference to Figs. 2-8.

[18126] GAM1304 gene, herein designated GAM GENE, and GAM1304 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18127] GAM1304 gene, herein designated GAM GENE, encodes a GAM1304 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1304 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1304 precursor RNA is designated SEQ ID:1281, and is provided hereinbelow with reference to the sequence listing part.

[18128] GAM1304 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18129] An enzyme complex designated DICER COMPLEX, dices the GAM1304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1304 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1304 RNA is designated SEQ ID:3886, and is provided

hereinbelow with reference to the sequence listing part.

[18130] GAM1304 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1304 target RNA, herein designated GAM TARGET RNA. GAM1304 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18131] GAM1304 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1304 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1304 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1304 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1304 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18132] The complementary binding of GAM1304 RNA, herein designated GAM RNA, to target binding sites on GAM1304 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1304 target RNA, herein designated GAM TARGET RNA, into GAM1304 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18133] It is appreciated that GAM1304 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1304 target genes. The mRNA of each one of this plurality of GAM1304 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1304 RNA, herein designated GAM RNA, and which when bound by GAM1304 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1304 target proteins.

[18134] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1304 gene, herein designated GAM GENE, on one or more GAM1304 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18135] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1304 correlate with, and may be deduced from, the identity of the target genes which GAM1304 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18136] Nucleotide sequences of the GAM1304 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1304 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1304 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1304 are further described hereinbelow with reference to Table 1.

[18137] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1304 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18138] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1305 (GAM1305) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18139] GAM1305 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1305 was detected is described hereinabove with reference to Figs. 2-8.

[18140] GAM1305 gene, herein designated GAM GENE, and GAM1305 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18141] GAM1305 gene, herein designated GAM GENE, encodes a GAM1305 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1305 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1305 precursor RNA is designated SEQ ID:1282, and is provided hereinbelow with reference to the sequence listing part.

[18142] GAM1305 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18143] An enzyme complex designated DICER COMPLEX, dices the GAM1305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1305 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1305 RNA is designated SEQ ID:3887, and is provided hereinbelow with reference to the sequence listing part.

[18144] GAM1305 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1305 target RNA, herein designated GAM TARGET RNA. GAM1305 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18145] GAM1305 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1305 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1305 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1305 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1305 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18146] The complementary binding of GAM1305 RNA, herein designated GAM RNA, to target binding sites on GAM1305 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1305 target RNA, herein designated GAM TARGET RNA, into GAM1305 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18147] It is appreciated that GAM1305 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1305 target genes. The mRNA of each one of this plurality of GAM1305 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1305 RNA, herein designated GAM RNA, and which when bound by GAM1305 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1305 target proteins.

[18148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1305 gene, herein designated GAM GENE, on one or more GAM1305 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18149] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1305 correlate with, and may be deduced from, the identity of the target genes which GAM1305 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18150] Nucleotide sequences of the GAM1305 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1305 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1305 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1305 are further described hereinbelow with reference to Table 1.

[18151] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1305 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18152] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1306 (GAM1306) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18153] GAM1306 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1306 was detected is described hereinabove with reference to Figs. 2-8.

[18154] GAM1306 gene, herein designated GAM GENE, and GAM1306 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18155] GAM1306 gene, herein designated GAM GENE, encodes a GAM1306 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1306 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1306 precursor RNA is designated SEQ ID:1283, and is provided hereinbelow with reference to the sequence listing part.

[18156] GAM1306 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18157] An enzyme complex designated DICER COMPLEX, dices the GAM1306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1306 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1306 RNA is designated SEQ ID:3888, and is provided hereinbelow with reference to the sequence listing part.

[18158] GAM1306 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1306 target RNA, herein designated GAM TARGET RNA. GAM1306 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18159] GAM1306 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1306 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1306 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1306 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1306 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18160] The complementary binding of GAM1306 RNA, herein designated GAM RNA, to target binding sites on GAM1306 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1306 target RNA, herein designated GAM TARGET RNA, into GAM1306 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18161] It is appreciated that GAM1306 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1306 target genes. The mRNA of each one of this plurality of GAM1306 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1306 RNA, herein designated GAM RNA, and which when bound by GAM1306 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1306 target proteins.

[18162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1306 gene, herein designated GAM GENE, on one or more GAM1306 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18163] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1306 correlate with, and may be deduced from, the identity of the target genes which GAM1306 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18164] Nucleotide sequences of the GAM1306 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1306 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1306 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1306 are further described hereinbelow with reference to Table 1.

[18165] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1306 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18166] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1307 (GAM1307) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18167] GAM1307 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1307 was detected is described hereinabove with reference to Figs. 2-8.

[18168] GAM1307 gene, herein designated GAM GENE, and GAM1307 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18169] GAM1307 gene, herein designated GAM GENE, encodes a GAM1307 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1307 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1307 precursor RNA is designated SEQ ID:1284, and is provided hereinbelow with reference to the sequence listing part.

[18170] GAM1307 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1307 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18171] An enzyme complex designated DICER COMPLEX, dices the GAM1307 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1307 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1307 RNA is designated SEQ ID:3889, and is provided hereinbelow with reference to the sequence listing part.

[18172] GAM1307 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1307 target RNA, herein designated GAM TARGET RNA. GAM1307 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18173] GAM1307 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1307 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1307 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1307 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1307 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18174] The complementary binding of GAM1307 RNA, herein designated GAM RNA, to target binding sites on GAM1307 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1307 target RNA, herein designated GAM TARGET RNA, into GAM1307 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18175] It is appreciated that GAM1307 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1307 target genes. The mRNA of each one of this plurality of GAM1307 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1307 RNA, herein designated GAM RNA, and which when bound by GAM1307 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1307 target proteins.

[18176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1307 gene, herein designated GAM GENE, on one or more GAM1307 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18177] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1307 correlate with, and may be deduced from, the identity of the target genes which GAM1307 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18178] Nucleotide sequences of the GAM1307 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1307 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1307 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1307 are further described hereinbelow with reference to Table 1.

[18179] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1307 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18180] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1308 (GAM1308) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18181] GAM1308 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1308 was detected is described hereinabove with reference to Figs. 2-8.

[18182] GAM1308 gene, herein designated GAM GENE, and GAM1308 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18183] GAM1308 gene, herein designated GAM GENE, encodes a GAM1308 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1308 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1308 precursor RNA is designated SEQ ID:1285, and is provided hereinbelow with reference to the sequence listing part.

[18184] GAM1308 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18185] An enzyme complex designated DICER COMPLEX, dices the GAM1308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1308 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1308 RNA is designated SEQ ID:3892, and is provided hereinbelow with reference to the sequence listing part.

[18186] GAM1308 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1308 target RNA, herein designated GAM TARGET RNA. GAM1308 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18187] GAM1308 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1308 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1308 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1308 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1308 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18188] The complementary binding of GAM1308 RNA, herein designated GAM RNA, to target binding sites on GAM1308 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1308 target RNA, herein designated GAM TARGET RNA, into GAM1308 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18189] It is appreciated that GAM1308 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1308 target genes. The

mRNA of each one of this plurality of GAM1308 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1308 RNA, herein designated GAM RNA, and which when bound by GAM1308 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1308 target proteins.

[18190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1308 gene, herein designated GAM GENE, on one or more GAM1308 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18191] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1308 correlate with, and may be deduced from, the identity of the target genes which GAM1308 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18192] Nucleotide sequences of the GAM1308 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1308 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1308 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1308 are further described hereinbelow with reference to Table 1.

[18193] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1308 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18194] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1309 (GAM1309) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18195] GAM1309 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1309 was detected is described hereinabove with reference to Figs. 2-8.

[18196] GAM1309 gene, herein designated GAM GENE, and GAM1309 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18197] GAM1309 gene, herein designated GAM GENE, encodes a GAM1309 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1309 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1309 precursor RNA is designated SEQ ID:1286, and is provided hereinbelow with reference to the sequence listing part.

[18198] GAM1309 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18199] An enzyme complex designated DICER COMPLEX, dices the GAM1309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1309 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1309 RNA is designated SEQ ID:3890, and is provided hereinbelow with reference to the sequence listing part.

[18200] GAM1309 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1309 target RNA, herein designated GAM TARGET RNA. GAM1309 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18201] GAM1309 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1309 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1309 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1309 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1309 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18202] The complementary binding of GAM1309 RNA, herein designated GAM RNA, to target binding sites on GAM1309 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1309 target RNA, herein designated GAM TARGET RNA, into GAM1309 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18203] It is appreciated that GAM1309 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1309 target genes. The mRNA of each one of this plurality of GAM1309 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1309 RNA, herein designated GAM RNA, and which when bound by GAM1309 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1309 target proteins.

[18204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1309 gene, herein designated GAM GENE, on one or more GAM1309 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18205] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1309 correlate with, and may be deduced from, the identity of the target

genes which GAM1309 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18206] Nucleotide sequences of the GAM1309 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1309 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1309 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1309 are further described hereinbelow with reference to Table 1.

[18207] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1309 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18208] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1310 (GAM1310) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18209] GAM1310 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1310 was detected is described hereinabove with reference to Figs. 2-8.

[18210] GAM1310 gene, herein designated GAM GENE, and GAM1310 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18211] GAM1310 gene, herein designated GAM GENE, encodes a GAM1310 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1310 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1310 precursor RNA is designated SEQ ID:1287, and is provided hereinbelow with reference to the sequence listing part.

[18212] GAM1310 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18213] An enzyme complex designated DICER COMPLEX, dices the GAM1310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1310 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1310 RNA is designated SEQ ID:3891, and is provided

hereinbelow with reference to the sequence listing part.

[18214] GAM1310 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1310 target RNA, herein designated GAM TARGET RNA. GAM1310 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18215] GAM1310 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1310 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1310 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1310 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1310 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18216] The complementary binding of GAM1310 RNA, herein designated GAM RNA, to target binding sites on GAM1310 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1310 target RNA, herein designated GAM TARGET RNA, into GAM1310 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18217] It is appreciated that GAM1310 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1310 target genes. The mRNA of each one of this plurality of GAM1310 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1310 RNA, herein designated GAM RNA, and which when bound by GAM1310 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1310 target proteins.

[18218] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1310 gene, herein designated GAM GENE, on one or more GAM1310 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18219] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1310 correlate with, and may be deduced from, the identity of the target genes which GAM1310 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18220] Nucleotide sequences of the GAM1310 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1310 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1310 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1310 are further described hereinbelow with reference to Table 1.

[18221] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1310 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18222] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1311 (GAM1311) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18223] GAM1311 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1311 was detected is described hereinabove with reference to Figs. 2-8.

[18224] GAM1311 gene, herein designated GAM GENE, and GAM1311 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18225] GAM1311 gene, herein designated GAM GENE, encodes a GAM1311 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1311 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1311 precursor RNA is designated SEQ ID:1288, and is provided hereinbelow with reference to the sequence listing part.

[18226] GAM1311 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18227] An enzyme complex designated DICER COMPLEX, dices the GAM1311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1311 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1311 RNA is designated SEQ ID:3893, and is provided hereinbelow with reference to the sequence listing part.

[18228] GAM1311 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1311 target RNA, herein designated GAM TARGET RNA. GAM1311 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18229] GAM1311 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1311 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1311 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1311 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1311 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18230] The complementary binding of GAM1311 RNA, herein designated GAM RNA, to target binding sites on GAM1311 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1311 target RNA, herein designated GAM TARGET RNA, into GAM1311 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18231] It is appreciated that GAM1311 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1311 target genes. The mRNA of each one of this plurality of GAM1311 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1311 RNA, herein designated GAM RNA, and which when bound by GAM1311 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1311 target proteins.

[18232] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1311 gene, herein designated GAM GENE, on one or more GAM1311 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18233] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1311 correlate with, and may be deduced from, the identity of the target genes which GAM1311 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18234] Nucleotide sequences of the GAM1311 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1311 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1311 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1311 are further described hereinbelow with reference to Table 1.

[18235] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1311 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18236] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1312 (GAM1312) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18237] GAM1312 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1312 was detected is described hereinabove with reference to Figs. 2-8.

[18238] GAM1312 gene, herein designated GAM GENE, and GAM1312 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18239] GAM1312 gene, herein designated GAM GENE, encodes a GAM1312 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1312 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1312 precursor RNA is designated SEQ ID:1289, and is provided hereinbelow with reference to the sequence listing part.

[18240] GAM1312 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18241] An enzyme complex designated DICER COMPLEX, dices the GAM1312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1312 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1312 RNA is designated SEQ ID:3894, and is provided hereinbelow with reference to the sequence listing part.

[18242] GAM1312 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1312 target RNA, herein designated GAM TARGET RNA. GAM1312 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18243] GAM1312 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1312 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1312 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1312 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1312 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18244] The complementary binding of GAM1312 RNA, herein designated GAM RNA, to target binding sites on GAM1312 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1312 target RNA, herein designated GAM TARGET RNA, into GAM1312 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18245] It is appreciated that GAM1312 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1312 target genes. The mRNA of each one of this plurality of GAM1312 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1312 RNA, herein designated GAM RNA, and which when bound by GAM1312 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1312 target proteins.

[18246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1312 gene, herein designated GAM GENE, on one or more GAM1312 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18247] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1312 correlate with, and may be deduced from, the identity of the target genes which GAM1312 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18248] Nucleotide sequences of the GAM1312 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1312 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1312 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1312 are further described hereinbelow with reference to Table 1.

[18249] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1312 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18250] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1313 (GAM1313) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18251] GAM1313 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1313 was detected is described hereinabove with reference to Figs. 2-8.

[18252] GAM1313 gene, herein designated GAM GENE, and GAM1313 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18253] GAM1313 gene, herein designated GAM GENE, encodes a GAM1313 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1313 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1313 precursor RNA is designated SEQ ID:1290, and is provided hereinbelow with reference to the sequence listing part.

[18254] GAM1313 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18255] An enzyme complex designated DICER COMPLEX, dices the GAM1313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1313 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1313 RNA is designated SEQ ID:3895, and is provided hereinbelow with reference to the sequence listing part.

[18256] GAM1313 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1313 target RNA, herein designated GAM TARGET RNA. GAM1313 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18257] GAM1313 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1313 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1313 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1313 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1313 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18258] The complementary binding of GAM1313 RNA, herein designated GAM RNA, to target binding sites on GAM1313 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1313 target RNA, herein designated GAM TARGET RNA, into GAM1313 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18259] It is appreciated that GAM1313 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1313 target genes. The mRNA of each one of this plurality of GAM1313 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1313 RNA, herein designated GAM RNA, and which when bound by GAM1313 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1313 target proteins.

[18260] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1313 gene, herein designated GAM GENE, on one or more GAM1313 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18261] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1313 correlate with, and may be deduced from, the identity of the target genes which GAM1313 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18262] Nucleotide sequences of the GAM1313 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1313 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1313 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1313 are further described hereinbelow with reference to Table 1.

[18263] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1313 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18264] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1314 (GAM1314) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18265] GAM1314 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1314 was detected is described hereinabove with reference to Figs. 2-8.

[18266] GAM1314 gene, herein designated GAM GENE, and GAM1314 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18267] GAM1314 gene, herein designated GAM GENE, encodes a GAM1314 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1314 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1314 precursor RNA is designated SEQ ID:1291, and is provided hereinbelow with reference to the sequence listing part.

[18268] GAM1314 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18269] An enzyme complex designated DICER COMPLEX, dices the GAM1314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1314 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1314 RNA is designated SEQ ID:3896, and is provided hereinbelow with reference to the sequence listing part.

[18270] GAM1314 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1314 target RNA, herein designated GAM TARGET RNA. GAM1314 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18271] GAM1314 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1314 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1314 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1314 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1314 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18272] The complementary binding of GAM1314 RNA, herein designated GAM RNA, to target binding sites on GAM1314 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1314 target RNA, herein designated GAM TARGET RNA, into GAM1314 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18273] It is appreciated that GAM1314 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1314 target genes. The

mRNA of each one of this plurality of GAM1314 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1314 RNA, herein designated GAM RNA, and which when bound by GAM1314 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1314 target proteins.

[18274] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1314 gene, herein designated GAM GENE, on one or more GAM1314 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18275] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1314 correlate with, and may be deduced from, the identity of the target genes which GAM1314 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18276] Nucleotide sequences of the GAM1314 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1314 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1314 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1314 are further described hereinbelow with reference to Table 1.

[18277] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1314 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18278] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1315 (GAM1315) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18279] GAM1315 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1315 was detected is described hereinabove with reference to Figs. 2-8.

[18280] GAM1315 gene, herein designated GAM GENE, and GAM1315 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18281] GAM1315 gene, herein designated GAM GENE, encodes a GAM1315 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1315 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1315 precursor RNA is designated SEQ ID:1292, and is provided hereinbelow with reference to the sequence listing part.

[18282] GAM1315 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18283] An enzyme complex designated DICER COMPLEX, dices the GAM1315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1315 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1315 RNA is designated SEQ ID:3898, and is provided hereinbelow with reference to the sequence listing part.

[18284] GAM1315 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1315 target RNA, herein designated GAM TARGET RNA. GAM1315 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18285] GAM1315 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1315 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1315 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1315 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1315 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18286] The complementary binding of GAM1315 RNA, herein designated GAM RNA, to target binding sites on GAM1315 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1315 target RNA, herein designated GAM TARGET RNA, into GAM1315 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18287] It is appreciated that GAM1315 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1315 target genes. The mRNA of each one of this plurality of GAM1315 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1315 RNA, herein designated GAM RNA, and which when bound by GAM1315 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1315 target proteins.

[18288] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1315 gene, herein designated GAM GENE, on one or more GAM1315 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18289] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1315 correlate with, and may be deduced from, the identity of the target

genes which GAM1315 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18290] Nucleotide sequences of the GAM1315 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1315 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1315 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1315 are further described hereinbelow with reference to Table 1.

[18291] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1315 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18292] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1316 (GAM1316) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18293] GAM1316 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1316 was detected is described hereinabove with reference to Figs. 2-8.

[18294] GAM1316 gene, herein designated GAM GENE, and GAM1316 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18295] GAM1316 gene, herein designated GAM GENE, encodes a GAM1316 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1316 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1316 precursor RNA is designated SEQ ID:1293, and is provided hereinbelow with reference to the sequence listing part.

[18296] GAM1316 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18297] An enzyme complex designated DICER COMPLEX, dices the GAM1316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1316 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1316 RNA is designated SEQ ID:3897, and is provided

hereinbelow with reference to the sequence listing part.

[18298] GAM1316 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1316 target RNA, herein designated GAM TARGET RNA. GAM1316 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18299] GAM1316 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1316 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1316 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1316 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1316 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18300] The complementary binding of GAM1316 RNA, herein designated GAM RNA, to target binding sites on GAM1316 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1316 target RNA, herein designated GAM TARGET RNA, into GAM1316 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18301] It is appreciated that GAM1316 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1316 target genes. The mRNA of each one of this plurality of GAM1316 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1316 RNA, herein designated GAM RNA, and which when bound by GAM1316 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1316 target proteins.

[18302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1316 gene, herein designated GAM GENE, on one or more GAM1316 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18303] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1316 correlate with, and may be deduced from, the identity of the target genes which GAM1316 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18304] Nucleotide sequences of the GAM1316 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1316 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1316 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1316 are further described hereinbelow with reference to Table 1.

[18305] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1316 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18306] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1317 (GAM1317) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18307] GAM1317 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1317 was detected is described hereinabove with reference to Figs. 2-8.

[18308] GAM1317 gene, herein designated GAM GENE, and GAM1317 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18309] GAM1317 gene, herein designated GAM GENE, encodes a GAM1317 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1317 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1317 precursor RNA is designated SEQ ID:1294, and is provided hereinbelow with reference to the sequence listing part.

[18310] GAM1317 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18311] An enzyme complex designated DICER COMPLEX, dices the GAM1317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1317 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1317 RNA is designated SEQ ID:3900, and is provided hereinbelow with reference to the sequence listing part.

[18312] GAM1317 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1317 target RNA, herein designated GAM TARGET RNA. GAM1317 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18313] GAM1317 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1317 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1317 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1317 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1317 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18314] The complementary binding of GAM1317 RNA, herein designated GAM RNA, to target binding sites on GAM1317 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1317 target RNA, herein designated GAM TARGET RNA, into GAM1317 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18315] It is appreciated that GAM1317 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1317 target genes. The mRNA of each one of this plurality of GAM1317 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1317 RNA, herein designated GAM RNA, and which when bound by GAM1317 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1317 target proteins.

[18316] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1317 gene, herein designated GAM GENE, on one or more GAM1317 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18317] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1317 correlate with, and may be deduced from, the identity of the target genes which GAM1317 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18318] Nucleotide sequences of the GAM1317 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1317 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1317 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1317 are further described hereinbelow with reference to Table 1.

[18319] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1317 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18320] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1318 (GAM1318) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18321] GAM1318 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1318 was detected is described hereinabove with reference to Figs. 2-8.

[18322] GAM1318 gene, herein designated GAM GENE, and GAM1318 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18323] GAM1318 gene, herein designated GAM GENE, encodes a GAM1318 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1318 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1318 precursor RNA is designated SEQ ID:1295, and is provided hereinbelow with reference to the sequence listing part.

[18324] GAM1318 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18325] An enzyme complex designated DICER COMPLEX, dices the GAM1318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1318 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1318 RNA is designated SEQ ID:3899, and is provided hereinbelow with reference to the sequence listing part.

[18326] GAM1318 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1318 target RNA, herein designated GAM TARGET RNA. GAM1318 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18327] GAM1318 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1318 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1318 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1318 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1318 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18328] The complementary binding of GAM1318 RNA, herein designated GAM RNA, to target binding sites on GAM1318 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1318 target RNA, herein designated GAM TARGET RNA, into GAM1318 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18329] It is appreciated that GAM1318 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1318 target genes. The mRNA of each one of this plurality of GAM1318 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1318 RNA, herein designated GAM RNA, and which when bound by GAM1318 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1318 target proteins.

[18330] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1318 gene, herein designated GAM GENE, on one or more GAM1318 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18331] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1318 correlate with, and may be deduced from, the identity of the target genes which GAM1318 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18332] Nucleotide sequences of the GAM1318 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1318 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1318 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1318 are further described hereinbelow with reference to Table 1.

[18333] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1318 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18334] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1319 (GAM1319) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18335] GAM1319 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1319 was detected is described hereinabove with reference to Figs. 2-8.

[18336] GAM1319 gene, herein designated GAM GENE, and GAM1319 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18337] GAM1319 gene, herein designated GAM GENE, encodes a GAM1319 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1319 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1319 precursor RNA is designated SEQ ID:1296, and is provided hereinbelow with reference to the sequence listing part.

[18338] GAM1319 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18339] An enzyme complex designated DICER COMPLEX, dices the GAM1319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1319 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1319 RNA is designated SEQ ID:3901, and is provided hereinbelow with reference to the sequence listing part.

[18340] GAM1319 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1319 target RNA, herein designated GAM TARGET RNA. GAM1319 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18341] GAM1319 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1319 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1319 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1319 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1319 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18342] The complementary binding of GAM1319 RNA, herein designated GAM RNA, to target binding sites on GAM1319 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1319 target RNA, herein designated GAM TARGET RNA, into GAM1319 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18343] It is appreciated that GAM1319 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1319 target genes. The mRNA of each one of this plurality of GAM1319 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1319 RNA, herein designated GAM RNA, and which when bound by GAM1319 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1319 target proteins.

[18344] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1319 gene, herein designated GAM GENE, on one or more GAM1319 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18345] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1319 correlate with, and may be deduced from, the identity of the target genes which GAM1319 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18346] Nucleotide sequences of the GAM1319 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1319 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1319 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1319 are further described hereinbelow with reference to Table 1.

[18347] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1319 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18348] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1320 (GAM1320) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18349] GAM1320 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1320 was detected is described hereinabove with reference to Figs. 2-8.

[18350] GAM1320 gene, herein designated GAM GENE, and GAM1320 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18351] GAM1320 gene, herein designated GAM GENE, encodes a GAM1320 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1320 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1320 precursor RNA is designated SEQ ID:1297, and is provided hereinbelow with reference to the sequence listing part.

[18352] GAM1320 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18353] An enzyme complex designated DICER COMPLEX, dices the GAM1320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1320 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1320 RNA is designated SEQ ID:3902, and is provided hereinbelow with reference to the sequence listing part.

[18354] GAM1320 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1320 target RNA, herein designated GAM TARGET RNA. GAM1320 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18355] GAM1320 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1320 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1320 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1320 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1320 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18356] The complementary binding of GAM1320 RNA, herein designated GAM RNA, to target binding sites on GAM1320 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1320 target RNA, herein designated GAM TARGET RNA, into GAM1320 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18357] It is appreciated that GAM1320 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1320 target genes. The

mRNA of each one of this plurality of GAM1320 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1320 RNA, herein designated GAM RNA, and which when bound by GAM1320 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1320 target proteins.

[18358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1320 gene, herein designated GAM GENE, on one or more GAM1320 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18359] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1320 correlate with, and may be deduced from, the identity of the target genes which GAM1320 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18360] Nucleotide sequences of the GAM1320 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1320 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1320 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1320 are further described hereinbelow with reference to Table 1.

[18361] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1320 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18362] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1321 (GAM1321) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18363] GAM1321 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1321 was detected is described hereinabove with reference to Figs. 2-8.

[18364] GAM1321 gene, herein designated GAM GENE, and GAM1321 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18365] GAM1321 gene, herein designated GAM GENE, encodes a GAM1321 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1321 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1321 precursor RNA is designated SEQ ID:1298, and is provided hereinbelow with reference to the sequence listing part.

[18366] GAM1321 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18367] An enzyme complex designated DICER COMPLEX, dices the GAM1321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1321 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1321 RNA is designated SEQ ID:3903, and is provided hereinbelow with reference to the sequence listing part.

[18368] GAM1321 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1321 target RNA, herein designated GAM TARGET RNA. GAM1321 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18369] GAM1321 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1321 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1321 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1321 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1321 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18370] The complementary binding of GAM1321 RNA, herein designated GAM RNA, to target binding sites on GAM1321 target RNA, herein designated

GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1321 target RNA, herein designated GAM TARGET RNA, into GAM1321 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18371] It is appreciated that GAM1321 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1321 target genes. The mRNA of each one of this plurality of GAM1321 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1321 RNA, herein designated GAM RNA, and which when bound by GAM1321 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1321 target proteins.

[18372] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1321 gene, herein designated GAM GENE, on one or more GAM1321 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18373] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1321 correlate with, and may be deduced from, the identity of the target genes which GAM1321 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18374] Nucleotide sequences of the GAM1321 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1321 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1321 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1321 are further described hereinbelow with reference to Table 1.

[18375] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1321 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18376] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1322 (GAM1322) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18377] GAM1322 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1322 was detected is described hereinabove with reference to Figs. 2-8.

[18378] GAM1322 gene, herein designated GAM GENE, and GAM1322 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18379] GAM1322 gene, herein designated GAM GENE, encodes a GAM1322 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1322 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1322 precursor RNA is designated SEQ ID:1299, and is provided hereinbelow with reference to the sequence listing part.

[18380] GAM1322 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18381] An enzyme complex designated DICER COMPLEX, dices the GAM1322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1322 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1322 RNA is designated SEQ ID:3904, and is provided hereinbelow with reference to the sequence listing part.

[18382] GAM1322 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1322 target RNA, herein designated GAM TARGET RNA. GAM1322 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18383] GAM1322 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1322 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1322 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1322 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1322 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[18384] The complementary binding of GAM1322 RNA, herein designated GAM RNA, to target binding sites on GAM1322 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1322 target RNA, herein designated GAM TARGET RNA, into GAM1322 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18385] It is appreciated that GAM1322 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1322 target genes. The mRNA of each one of this plurality of GAM1322 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1322 RNA, herein designated GAM RNA, and which when bound by GAM1322 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1322 target proteins.

[18386] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1322 gene, herein designated GAM GENE, on one or more GAM1322 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18387] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1322 correlate with, and may be deduced from, the identity of the target genes which GAM1322 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18388] Nucleotide sequences of the GAM1322 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1322 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1322 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1322 are further described hereinbelow with reference to Table 1.

[18389] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1322 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18390] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1323 (GAM1323) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18391] GAM1323 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1323 was detected is described hereinabove with reference to Figs. 2-8.

[18392] GAM1323 gene, herein designated GAM GENE, and GAM1323 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18393] GAM1323 gene, herein designated GAM GENE, encodes a GAM1323 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1323 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1323 precursor RNA is designated SEQ ID:1300, and is provided hereinbelow with reference to the sequence listing part.

[18394] GAM1323 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18395] An enzyme complex designated DICER COMPLEX, dices the GAM1323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1323 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1323 RNA is designated SEQ ID:3905, and is provided hereinbelow with reference to the sequence listing part.

[18396] GAM1323 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1323 target RNA, herein designated GAM TARGET RNA. GAM1323 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18397] GAM1323 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1323 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1323 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1323 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1323 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18398] The complementary binding of GAM1323 RNA, herein designated GAM RNA, to target binding sites on GAM1323 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1323 target RNA, herein designated GAM TARGET RNA, into GAM1323 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18399] It is appreciated that GAM1323 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1323 target genes. The mRNA of each one of this plurality of GAM1323 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1323 RNA, herein designated GAM RNA, and which when bound by GAM1323 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1323 target proteins.

[18400] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1323 gene, herein designated GAM GENE, on one or more GAM1323 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18401] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1323 correlate with, and may be deduced from, the identity of the target genes which GAM1323 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18402] Nucleotide sequences of the GAM1323 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1323 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1323 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1323 are further described hereinbelow with reference to Table 1.

[18403] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1323 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18404] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1324 (GAM1324) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18405] GAM1324 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1324 was detected is described hereinabove with reference to Figs. 2-8.

[18406] GAM1324 gene, herein designated GAM GENE, and GAM1324 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18407] GAM1324 gene, herein designated GAM GENE, encodes a GAM1324 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1324 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1324 precursor RNA is designated SEQ ID:1301, and is provided hereinbelow with reference to the sequence listing part.

[18408] GAM1324 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18409] An enzyme complex designated DICER COMPLEX, dices the GAM1324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1324 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1324 RNA is designated SEQ ID:3906, and is provided hereinbelow with reference to the sequence listing part.

[18410] GAM1324 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1324 target RNA, herein designated GAM TARGET RNA. GAM1324 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18411] GAM1324 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1324 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1324 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1324 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1324 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18412] The complementary binding of GAM1324 RNA, herein designated GAM RNA, to target binding sites on GAM1324 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1324 target RNA, herein designated GAM TARGET RNA, into GAM1324 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18413] It is appreciated that GAM1324 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1324 target genes. The mRNA of each one of this plurality of GAM1324 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1324 RNA, herein designated GAM RNA, and which when bound by GAM1324 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1324 target proteins.

[18414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1324 gene, herein designated GAM GENE, on one or more GAM1324 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18415] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1324 correlate with, and may be deduced from, the identity of the target genes which GAM1324 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18416] Nucleotide sequences of the GAM1324 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1324 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1324 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1324 are further described hereinbelow with reference to Table 1.

[18417] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1324 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18418] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1325 (GAM1325) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18419] GAM1325 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1325 was detected is described hereinabove with reference to Figs. 2-8.

[18420] GAM1325 gene, herein designated GAM GENE, and GAM1325 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18421] GAM1325 gene, herein designated GAM GENE, encodes a GAM1325 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1325 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1325 precursor RNA is designated SEQ ID:1302, and is provided hereinbelow with reference to the sequence listing part.

[18422] GAM1325 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18423] An enzyme complex designated DICER COMPLEX, dices the GAM1325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1325 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1325 RNA is designated SEQ ID:3907, and is provided hereinbelow with reference to the sequence listing part.

[18424] GAM1325 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1325 target RNA, herein designated GAM TARGET RNA. GAM1325 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18425] GAM1325 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1325 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1325 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1325 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1325 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18426] The complementary binding of GAM1325 RNA, herein designated GAM RNA, to target binding sites on GAM1325 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1325 target RNA, herein designated GAM TARGET RNA, into GAM1325 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18427] It is appreciated that GAM1325 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1325 target genes. The mRNA of each one of this plurality of GAM1325 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1325 RNA, herein designated GAM RNA, and which when bound by GAM1325 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1325 target proteins.

[18428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1325 gene, herein designated GAM GENE, on one or more GAM1325 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18429] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1325 correlate with, and may be deduced from, the identity of the target genes which GAM1325 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18430] Nucleotide sequences of the GAM1325 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1325 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1325 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1325 are further described hereinbelow with reference to Table 1.

[18431] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1325 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18432] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1326 (GAM1326) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18433] GAM1326 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1326 was detected is described hereinabove with reference to Figs. 2-8.

[18434] GAM1326 gene, herein designated GAM GENE, and GAM1326 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18435] GAM1326 gene, herein designated GAM GENE, encodes a GAM1326 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1326 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1326 precursor RNA is designated SEQ ID:1303, and is provided hereinbelow with reference to the sequence listing part.

[18436] GAM1326 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18437] An enzyme complex designated DICER COMPLEX, dices the GAM1326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1326 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1326 RNA is designated SEQ ID:3910, and is provided hereinbelow with reference to the sequence listing part.

[18438] GAM1326 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1326 target RNA, herein designated GAM TARGET RNA. GAM1326 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18439] GAM1326 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1326 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1326 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1326 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1326 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18440] The complementary binding of GAM1326 RNA, herein designated GAM RNA, to target binding sites on GAM1326 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1326 target RNA, herein designated GAM TARGET RNA, into GAM1326 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18441] It is appreciated that GAM1326 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1326 target genes. The

mRNA of each one of this plurality of GAM1326 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1326 RNA, herein designated GAM RNA, and which when bound by GAM1326 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1326 target proteins.

[18442] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1326 gene, herein designated GAM GENE, on one or more GAM1326 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18443] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1326 correlate with, and may be deduced from, the identity of the target genes which GAM1326 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18444] Nucleotide sequences of the GAM1326 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1326 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1326 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1326 are further described hereinbelow with reference to Table 1.

[18445] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1326 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18446] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1327 (GAM1327) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18447] GAM1327 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1327 was detected is described hereinabove with reference to Figs. 2-8.

[18448] GAM1327 gene, herein designated GAM GENE, and GAM1327 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18449] GAM1327 gene, herein designated GAM GENE, encodes a GAM1327 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1327 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1327 precursor RNA is designated SEQ ID:1304, and is provided hereinbelow with reference to the sequence listing part.

[18450] GAM1327 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18451] An enzyme complex designated DICER COMPLEX, dices the GAM1327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1327 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1327 RNA is designated SEQ ID:3908, and is provided hereinbelow with reference to the sequence listing part.

[18452] GAM1327 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1327 target RNA, herein designated GAM TARGET RNA. GAM1327 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18453] GAM1327 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1327 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1327 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1327 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1327 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18454] The complementary binding of GAM1327 RNA, herein designated GAM RNA, to target binding sites on GAM1327 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1327 target RNA, herein designated GAM TARGET RNA, into GAM1327 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18455] It is appreciated that GAM1327 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1327 target genes. The mRNA of each one of this plurality of GAM1327 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1327 RNA, herein designated GAM RNA, and which when bound by GAM1327 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1327 target proteins.

[18456] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1327 gene, herein designated GAM GENE, on one or more GAM1327 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18457] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1327 correlate with, and may be deduced from, the identity of the target

genes which GAM1327 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18458] Nucleotide sequences of the GAM1327 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1327 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1327 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1327 are further described hereinbelow with reference to Table 1.

[18459] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1327 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18460] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1328 (GAM1328) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18461] GAM1328 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1328 was detected is described hereinabove with reference to Figs. 2-8.

[18462] GAM1328 gene, herein designated GAM GENE, and GAM1328 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18463] GAM1328 gene, herein designated GAM GENE, encodes a GAM1328 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1328 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1328 precursor RNA is designated SEQ ID:1305, and is provided hereinbelow with reference to the sequence listing part.

[18464] GAM1328 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18465] An enzyme complex designated DICER COMPLEX, dices the GAM1328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1328 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1328 RNA is designated SEQ ID:3909, and is provided

hereinbelow with reference to the sequence listing part.

[18466] GAM1328 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1328 target RNA, herein designated GAM TARGET RNA. GAM1328 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18467] GAM1328 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1328 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1328 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1328 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1328 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18468] The complementary binding of GAM1328 RNA, herein designated GAM RNA, to target binding sites on GAM1328 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1328 target RNA, herein designated GAM TARGET RNA, into GAM1328 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18469] It is appreciated that GAM1328 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1328 target genes. The mRNA of each one of this plurality of GAM1328 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1328 RNA, herein designated GAM RNA, and which when bound by GAM1328 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1328 target proteins.

[18470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1328 gene, herein designated GAM GENE, on one or more GAM1328 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18471] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1328 correlate with, and may be deduced from, the identity of the target genes which GAM1328 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18472] Nucleotide sequences of the GAM1328 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1328 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1328 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1328 are further described hereinbelow with reference to Table 1.

[18473] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1328 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18474] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1329 (GAM1329) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18475] GAM1329 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1329 was detected is described hereinabove with reference to Figs. 2-8.

[18476] GAM1329 gene, herein designated GAM GENE, and GAM1329 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18477] GAM1329 gene, herein designated GAM GENE, encodes a GAM1329 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1329 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1329 precursor RNA is designated SEQ ID:1306, and is provided hereinbelow with reference to the sequence listing part.

[18478] GAM1329 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18479] An enzyme complex designated DICER COMPLEX, dices the GAM1329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1329 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1329 RNA is designated SEQ ID:3911, and is provided hereinbelow with reference to the sequence listing part.

[18480] GAM1329 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1329 target RNA, herein designated GAM TARGET RNA. GAM1329 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18481] GAM1329 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1329 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1329 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1329 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1329 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18482] The complementary binding of GAM1329 RNA, herein designated GAM RNA, to target binding sites on GAM1329 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1329 target RNA, herein designated GAM TARGET RNA, into GAM1329 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18483] It is appreciated that GAM1329 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1329 target genes. The mRNA of each one of this plurality of GAM1329 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1329 RNA, herein designated GAM RNA, and which when bound by GAM1329 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1329 target proteins.

[18484] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1329 gene, herein designated GAM GENE, on one or more GAM1329 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18485] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1329 correlate with, and may be deduced from, the identity of the target genes which GAM1329 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18486] Nucleotide sequences of the GAM1329 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1329 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1329 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1329 are further described hereinbelow with reference to Table 1.

[18487] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1329 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18488] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1330 (GAM1330) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18489] GAM1330 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1330 was detected is described hereinabove with reference to Figs. 2-8.

[18490] GAM1330 gene, herein designated GAM GENE, and GAM1330 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18491] GAM1330 gene, herein designated GAM GENE, encodes a GAM1330 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1330 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1330 precursor RNA is designated SEQ ID:1307, and is provided hereinbelow with reference to the sequence listing part.

[18492] GAM1330 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18493] An enzyme complex designated DICER COMPLEX, dices the GAM1330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1330 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1330 RNA is designated SEQ ID:3912, and is provided hereinbelow with reference to the sequence listing part.

[18494] GAM1330 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1330 target RNA, herein designated GAM TARGET RNA. GAM1330 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18495] GAM1330 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1330 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1330 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1330 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1330 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18496] The complementary binding of GAM1330 RNA, herein designated GAM RNA, to target binding sites on GAM1330 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1330 target RNA, herein designated GAM TARGET RNA, into GAM1330 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18497] It is appreciated that GAM1330 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1330 target genes. The mRNA of each one of this plurality of GAM1330 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1330 RNA, herein designated GAM RNA, and which when bound by GAM1330 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1330 target proteins.

[18498] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1330 gene, herein designated GAM GENE, on one or more GAM1330 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18499] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1330 correlate with, and may be deduced from, the identity of the target genes which GAM1330 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18500] Nucleotide sequences of the GAM1330 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1330 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1330 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1330 are further described hereinbelow with reference to Table 1.

[18501] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1330 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18502] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1331 (GAM1331) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18503] GAM1331 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1331 was detected is described hereinabove with reference to Figs. 2-8.

[18504] GAM1331 gene, herein designated GAM GENE, and GAM1331 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18505] GAM1331 gene, herein designated GAM GENE, encodes a GAM1331 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1331 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1331 precursor RNA is designated SEQ ID:1308, and is provided hereinbelow with reference to the sequence listing part.

[18506] GAM1331 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18507] An enzyme complex designated DICER COMPLEX, dices the GAM1331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1331 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1331 RNA is designated SEQ ID:3913, and is provided hereinbelow with reference to the sequence listing part.

[18508] GAM1331 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1331 target RNA, herein designated GAM TARGET RNA. GAM1331 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18509] GAM1331 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1331 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1331 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1331 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1331 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18510] The complementary binding of GAM1331 RNA, herein designated GAM RNA, to target binding sites on GAM1331 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1331 target RNA, herein designated GAM TARGET RNA, into GAM1331 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18511] It is appreciated that GAM1331 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1331 target genes. The mRNA of each one of this plurality of GAM1331 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1331 RNA, herein designated GAM RNA, and which when bound by GAM1331 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1331 target proteins.

[18512] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1331 gene, herein designated GAM GENE, on one or more GAM1331 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18513] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1331 correlate with, and may be deduced from, the identity of the target genes which GAM1331 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18514] Nucleotide sequences of the GAM1331 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1331 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1331 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1331 are further described hereinbelow with reference to Table 1.

[18515] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1331 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18516] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1332 (GAM1332) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18517] GAM1332 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1332 was detected is described hereinabove with reference to Figs. 2-8.

[18518] GAM1332 gene, herein designated GAM GENE, and GAM1332 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18519] GAM1332 gene, herein designated GAM GENE, encodes a GAM1332 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1332 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1332 precursor RNA is designated SEQ ID:1309, and is provided hereinbelow with reference to the sequence listing part.

[18520] GAM1332 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18521] An enzyme complex designated DICER COMPLEX, dices the GAM1332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1332 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1332 RNA is designated SEQ ID:3914, and is provided hereinbelow with reference to the sequence listing part.

[18522] GAM1332 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1332 target RNA, herein designated GAM TARGET RNA. GAM1332 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18523] GAM1332 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1332 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1332 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1332 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1332 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18524] The complementary binding of GAM1332 RNA, herein designated GAM RNA, to target binding sites on GAM1332 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1332 target RNA, herein designated GAM TARGET RNA, into GAM1332 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18525] It is appreciated that GAM1332 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1332 target genes. The

mRNA of each one of this plurality of GAM1332 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1332 RNA, herein designated GAM RNA, and which when bound by GAM1332 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1332 target proteins.

[18526] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1332 gene, herein designated GAM GENE, on one or more GAM1332 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18527] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1332 correlate with, and may be deduced from, the identity of the target genes which GAM1332 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18528] Nucleotide sequences of the GAM1332 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1332 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1332 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1332 are further described hereinbelow with reference to Table 1.

[18529] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1332 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18530] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1333 (GAM1333) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18531] GAM1333 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1333 was detected is described hereinabove with reference to Figs. 2-8.

[18532] GAM1333 gene, herein designated GAM GENE, and GAM1333 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18533] GAM1333 gene, herein designated GAM GENE, encodes a GAM1333 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1333 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1333 precursor RNA is designated SEQ ID:1310, and is provided hereinbelow with reference to the sequence listing part.

[18534] GAM1333 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18535] An enzyme complex designated DICER COMPLEX, dices the GAM1333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1333 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1333 RNA is designated SEQ ID:3915, and is provided hereinbelow with reference to the sequence listing part.

[18536] GAM1333 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1333 target RNA, herein designated GAM TARGET RNA. GAM1333 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18537] GAM1333 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1333 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1333 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1333 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1333 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18538] The complementary binding of GAM1333 RNA, herein designated GAM RNA, to target binding sites on GAM1333 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1333 target RNA, herein designated GAM TARGET RNA, into GAM1333 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18539] It is appreciated that GAM1333 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1333 target genes. The mRNA of each one of this plurality of GAM1333 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1333 RNA, herein designated GAM RNA, and which when bound by GAM1333 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1333 target proteins.

[18540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1333 gene, herein designated GAM GENE, on one or more GAM1333 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18541] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1333 correlate with, and may be deduced from, the identity of the target

genes which GAM1333 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18542] Nucleotide sequences of the GAM1333 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1333 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1333 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1333 are further described hereinbelow with reference to Table 1.

[18543] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1333 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18544] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1334 (GAM1334) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18545] GAM1334 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1334 was detected is described hereinabove with reference to Figs. 2-8.

[18546] GAM1334 gene, herein designated GAM GENE, and GAM1334 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18547] GAM1334 gene, herein designated GAM GENE, encodes a GAM1334 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1334 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1334 precursor RNA is designated SEQ ID:1311, and is provided hereinbelow with reference to the sequence listing part.

[18548] GAM1334 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18549] An enzyme complex designated DICER COMPLEX, dices the GAM1334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1334 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1334 RNA is designated SEQ ID:3916, and is provided

hereinbelow with reference to the sequence listing part.

[18550] GAM1334 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1334 target RNA, herein designated GAM TARGET RNA. GAM1334 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18551] GAM1334 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1334 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1334 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1334 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1334 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18552] The complementary binding of GAM1334 RNA, herein designated GAM RNA, to target binding sites on GAM1334 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1334 target RNA, herein designated GAM TARGET RNA, into GAM1334 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18553] It is appreciated that GAM1334 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1334 target genes. The mRNA of each one of this plurality of GAM1334 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1334 RNA, herein designated GAM RNA, and which when bound by GAM1334 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1334 target proteins.

[18554] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1334 gene, herein designated GAM GENE, on one or more GAM1334 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18555] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1334 correlate with, and may be deduced from, the identity of the target genes which GAM1334 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18556] Nucleotide sequences of the GAM1334 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1334 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1334 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1334 are further described hereinbelow with reference to Table 1.

[18557] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1334 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18558] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1335 (GAM1335) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18559] GAM1335 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1335 was detected is described hereinabove with reference to Figs. 2-8.

[18560] GAM1335 gene, herein designated GAM GENE, and GAM1335 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18561] GAM1335 gene, herein designated GAM GENE, encodes a GAM1335 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1335 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1335 precursor RNA is designated SEQ ID:1312, and is provided hereinbelow with reference to the sequence listing part.

[18562] GAM1335 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18563] An enzyme complex designated DICER COMPLEX, dices the GAM1335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1335 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1335 RNA is designated SEQ ID:3917, and is provided hereinbelow with reference to the sequence listing part.

[18564] GAM1335 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1335 target RNA, herein designated GAM TARGET RNA. GAM1335 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18565] GAM1335 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1335 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1335 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1335 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1335 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18566] The complementary binding of GAM1335 RNA, herein designated GAM RNA, to target binding sites on GAM1335 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1335 target RNA, herein designated GAM TARGET RNA, into GAM1335 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18567] It is appreciated that GAM1335 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1335 target genes. The mRNA of each one of this plurality of GAM1335 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1335 RNA, herein designated GAM RNA, and which when bound by GAM1335 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1335 target proteins.

[18568] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1335 gene, herein designated GAM GENE, on one or more GAM1335 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18569] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1335 correlate with, and may be deduced from, the identity of the target genes which GAM1335 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18570] Nucleotide sequences of the GAM1335 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1335 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1335 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1335 are further described hereinbelow with reference to Table 1.

[18571] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1335 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18572] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1336 (GAM1336) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18573] GAM1336 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1336 was detected is described hereinabove with reference to Figs. 2-8.

[18574] GAM1336 gene, herein designated GAM GENE, and GAM1336 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18575] GAM1336 gene, herein designated GAM GENE, encodes a GAM1336 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1336 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1336 precursor RNA is designated SEQ ID:1313, and is provided hereinbelow with reference to the sequence listing part.

[18576] GAM1336 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18577] An enzyme complex designated DICER COMPLEX, dices the GAM1336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1336 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1336 RNA is designated SEQ ID:3918, and is provided hereinbelow with reference to the sequence listing part.

[18578] GAM1336 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1336 target RNA, herein designated GAM TARGET RNA. GAM1336 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18579] GAM1336 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1336 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1336 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1336 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1336 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18580] The complementary binding of GAM1336 RNA, herein designated GAM RNA, to target binding sites on GAM1336 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1336 target RNA, herein designated GAM TARGET RNA, into GAM1336 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18581] It is appreciated that GAM1336 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1336 target genes. The mRNA of each one of this plurality of GAM1336 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1336 RNA, herein designated GAM RNA, and which when bound by GAM1336 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1336 target proteins.

[18582] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1336 gene, herein designated GAM GENE, on one or more GAM1336 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18583] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1336 correlate with, and may be deduced from, the identity of the target genes which GAM1336 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18584] Nucleotide sequences of the GAM1336 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1336 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1336 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1336 are further described hereinbelow with reference to Table 1.

[18585] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1336 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18586] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1337 (GAM1337) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18587] GAM1337 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1337 was detected is described hereinabove with reference to Figs. 2-8.

[18588] GAM1337 gene, herein designated GAM GENE, and GAM1337 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18589] GAM1337 gene, herein designated GAM GENE, encodes a GAM1337 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1337 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1337 precursor RNA is designated SEQ ID:1314, and is provided hereinbelow with reference to the sequence listing part.

[18590] GAM1337 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18591] An enzyme complex designated DICER COMPLEX, dices the GAM1337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1337 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1337 RNA is designated SEQ ID:3919, and is provided hereinbelow with reference to the sequence listing part.

[18592] GAM1337 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1337 target RNA, herein designated GAM TARGET RNA. GAM1337 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18593] GAM1337 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1337 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1337 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1337 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1337 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18594] The complementary binding of GAM1337 RNA, herein designated GAM RNA, to target binding sites on GAM1337 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1337 target RNA, herein designated GAM TARGET RNA, into GAM1337 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18595] It is appreciated that GAM1337 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1337 target genes. The mRNA of each one of this plurality of GAM1337 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1337 RNA, herein designated GAM RNA, and which when bound by GAM1337 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1337 target proteins.

[18596] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1337 gene, herein designated GAM GENE, on one or more GAM1337 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18597] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1337 correlate with, and may be deduced from, the identity of the target genes which GAM1337 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18598] Nucleotide sequences of the GAM1337 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1337 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1337 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1337 are further described hereinbelow with reference to Table 1.

[18599] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1337 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18600] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1338 (GAM1338) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18601] GAM1338 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1338 was detected is described hereinabove with reference to Figs. 2-8.

[18602] GAM1338 gene, herein designated GAM GENE, and GAM1338 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18603] GAM1338 gene, herein designated GAM GENE, encodes a GAM1338 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1338 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1338 precursor RNA is designated SEQ ID:1315, and is provided hereinbelow with reference to the sequence listing part.

[18604] GAM1338 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18605] An enzyme complex designated DICER COMPLEX, dices the GAM1338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1338 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1338 RNA is designated SEQ ID:3920, and is provided hereinbelow with reference to the sequence listing part.

[18606] GAM1338 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1338 target RNA, herein designated GAM TARGET RNA. GAM1338 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18607] GAM1338 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1338 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1338 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1338 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1338 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18608] The complementary binding of GAM1338 RNA, herein designated GAM RNA, to target binding sites on GAM1338 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1338 target RNA, herein designated GAM TARGET RNA, into GAM1338 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18609] It is appreciated that GAM1338 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1338 target genes. The

mRNA of each one of this plurality of GAM1338 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1338 RNA, herein designated GAM RNA, and which when bound by GAM1338 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1338 target proteins.

[18610] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1338 gene, herein designated GAM GENE, on one or more GAM1338 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18611] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1338 correlate with, and may be deduced from, the identity of the target genes which GAM1338 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18612] Nucleotide sequences of the GAM1338 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1338 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1338 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1338 are further described hereinbelow with reference to Table 1.

[18613] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1338 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18614] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1339 (GAM1339) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18615] GAM1339 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1339 was detected is described hereinabove with reference to Figs. 2-8.

[18616] GAM1339 gene, herein designated GAM GENE, and GAM1339 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18617] GAM1339 gene, herein designated GAM GENE, encodes a GAM1339 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1339 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1339 precursor RNA is designated SEQ ID:1316, and is provided hereinbelow with reference to the sequence listing part.

[18618] GAM1339 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18619] An enzyme complex designated DICER COMPLEX, dices the GAM1339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1339 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1339 RNA is designated SEQ ID:3921, and is provided hereinbelow with reference to the sequence listing part.

[18620] GAM1339 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1339 target RNA, herein designated GAM TARGET RNA. GAM1339 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18621] GAM1339 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1339 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1339 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1339 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1339 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18622] The complementary binding of GAM1339 RNA, herein designated GAM RNA, to target binding sites on GAM1339 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1339 target RNA, herein designated GAM TARGET RNA, into GAM1339 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18623] It is appreciated that GAM1339 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1339 target genes. The mRNA of each one of this plurality of GAM1339 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1339 RNA, herein designated GAM RNA, and which when bound by GAM1339 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1339 target proteins.

[18624] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1339 gene, herein designated GAM GENE, on one or more GAM1339 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18625] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1339 correlate with, and may be deduced from, the identity of the target

genes which GAM1339 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18626] Nucleotide sequences of the GAM1339 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1339 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1339 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1339 are further described hereinbelow with reference to Table 1.

[18627] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1339 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18628] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1340 (GAM1340) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18629] GAM1340 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1340 was detected is described hereinabove with reference to Figs. 2-8.

[18630] GAM1340 gene, herein designated GAM GENE, and GAM1340 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18631] GAM1340 gene, herein designated GAM GENE, encodes a GAM1340 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1340 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1340 precursor RNA is designated SEQ ID:1317, and is provided hereinbelow with reference to the sequence listing part.

[18632] GAM1340 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18633] An enzyme complex designated DICER COMPLEX, dices the GAM1340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1340 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1340 RNA is designated SEQ ID:3922, and is provided

hereinbelow with reference to the sequence listing part.

[18634] GAM1340 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1340 target RNA, herein designated GAM TARGET RNA. GAM1340 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18635] GAM1340 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1340 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1340 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1340 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1340 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18636] The complementary binding of GAM1340 RNA, herein designated GAM RNA, to target binding sites on GAM1340 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1340 target RNA, herein designated GAM TARGET RNA, into GAM1340 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18637] It is appreciated that GAM1340 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1340 target genes. The mRNA of each one of this plurality of GAM1340 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1340 RNA, herein designated GAM RNA, and which when bound by GAM1340 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1340 target proteins.

[18638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1340 gene, herein designated GAM GENE, on one or more GAM1340 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18639] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1340 correlate with, and may be deduced from, the identity of the target genes which GAM1340 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18640] Nucleotide sequences of the GAM1340 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1340 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1340 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1340 are further described hereinbelow with reference to Table 1.

[18641] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1340 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18642] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1341 (GAM1341) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18643] GAM1341 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1341 was detected is described hereinabove with reference to Figs. 2-8.

[18644] GAM1341 gene, herein designated GAM GENE, and GAM1341 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18645] GAM1341 gene, herein designated GAM GENE, encodes a GAM1341 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1341 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1341 precursor RNA is designated SEQ ID:1318, and is provided hereinbelow with reference to the sequence listing part.

[18646] GAM1341 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18647] An enzyme complex designated DICER COMPLEX, dices the GAM1341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1341 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1341 RNA is designated SEQ ID:3923, and is provided hereinbelow with reference to the sequence listing part.

[18648] GAM1341 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1341 target RNA, herein designated GAM TARGET RNA. GAM1341 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18649] GAM1341 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1341 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1341 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1341 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1341 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18650] The complementary binding of GAM1341 RNA, herein designated GAM RNA, to target binding sites on GAM1341 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1341 target RNA, herein designated GAM TARGET RNA, into GAM1341 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18651] It is appreciated that GAM1341 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1341 target genes. The mRNA of each one of this plurality of GAM1341 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1341 RNA, herein designated GAM RNA, and which when bound by GAM1341 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1341 target proteins.

[18652] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1341 gene, herein designated GAM GENE, on one or more GAM1341 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18653] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1341 correlate with, and may be deduced from, the identity of the target genes which GAM1341 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18654] Nucleotide sequences of the GAM1341 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1341 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1341 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1341 are further described hereinbelow with reference to Table 1.

[18655] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1341 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18656] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1342 (GAM1342) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18657] GAM1342 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1342 was detected is described hereinabove with reference to Figs. 2-8.

[18658] GAM1342 gene, herein designated GAM GENE, and GAM1342 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18659] GAM1342 gene, herein designated GAM GENE, encodes a GAM1342 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1342 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1342 precursor RNA is designated SEQ ID:1319, and is provided hereinbelow with reference to the sequence listing part.

[18660] GAM1342 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18661] An enzyme complex designated DICER COMPLEX, dices the GAM1342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1342 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1342 RNA is designated SEQ ID:3924, and is provided hereinbelow with reference to the sequence listing part.

[18662] GAM1342 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1342 target RNA, herein designated GAM TARGET RNA. GAM1342 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18663] GAM1342 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1342 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1342 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1342 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1342 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18664] The complementary binding of GAM1342 RNA, herein designated GAM RNA, to target binding sites on GAM1342 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1342 target RNA, herein designated GAM TARGET RNA, into GAM1342 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18665] It is appreciated that GAM1342 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1342 target genes. The mRNA of each one of this plurality of GAM1342 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1342 RNA, herein designated GAM RNA, and which when bound by GAM1342 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1342 target proteins.

[18666] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1342 gene, herein designated GAM GENE, on one or more GAM1342 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18667] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1342 correlate with, and may be deduced from, the identity of the target genes which GAM1342 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18668] Nucleotide sequences of the GAM1342 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1342 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1342 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1342 are further described hereinbelow with reference to Table 1.

[18669] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1342 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18670] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1343 (GAM1343) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18671] GAM1343 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1343 was detected is described hereinabove with reference to Figs. 2-8.

[18672] GAM1343 gene, herein designated GAM GENE, and GAM1343 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18673] GAM1343 gene, herein designated GAM GENE, encodes a GAM1343 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1343 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1343 precursor RNA is designated SEQ ID:1320, and is provided hereinbelow with reference to the sequence listing part.

[18674] GAM1343 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18675] An enzyme complex designated DICER COMPLEX, dices the GAM1343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1343 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1343 RNA is designated SEQ ID:3925, and is provided hereinbelow with reference to the sequence listing part.

[18676] GAM1343 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1343 target RNA, herein designated GAM TARGET RNA. GAM1343 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18677] GAM1343 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1343 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1343 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1343 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1343 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18678] The complementary binding of GAM1343 RNA, herein designated GAM RNA, to target binding sites on GAM1343 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1343 target RNA, herein designated GAM TARGET RNA, into GAM1343 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18679] It is appreciated that GAM1343 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1343 target genes. The mRNA of each one of this plurality of GAM1343 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1343 RNA, herein designated GAM RNA, and which when bound by GAM1343 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1343 target proteins.

[18680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1343 gene, herein designated GAM GENE, on one or more GAM1343 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18681] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1343 correlate with, and may be deduced from, the identity of the target genes which GAM1343 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18682] Nucleotide sequences of the GAM1343 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1343 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1343 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1343 are further described hereinbelow with reference to Table 1.

[18683] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1343 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18684] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1344 (GAM1344) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18685] GAM1344 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1344 was detected is described hereinabove with reference to Figs. 2-8.

[18686] GAM1344 gene, herein designated GAM GENE, and GAM1344 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18687] GAM1344 gene, herein designated GAM GENE, encodes a GAM1344 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1344 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1344 precursor RNA is designated SEQ ID:1321, and is provided hereinbelow with reference to the sequence listing part.

[18688] GAM1344 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18689] An enzyme complex designated DICER COMPLEX, dices the GAM1344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1344 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1344 RNA is designated SEQ ID:3927, and is provided hereinbelow with reference to the sequence listing part.

[18690] GAM1344 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1344 target RNA, herein designated GAM TARGET RNA. GAM1344 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18691] GAM1344 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1344 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1344 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1344 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1344 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18692] The complementary binding of GAM1344 RNA, herein designated GAM RNA, to target binding sites on GAM1344 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1344 target RNA, herein designated GAM TARGET RNA, into GAM1344 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18693] It is appreciated that GAM1344 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1344 target genes. The

mRNA of each one of this plurality of GAM1344 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1344 RNA, herein designated GAM RNA, and which when bound by GAM1344 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1344 target proteins.

[18694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1344 gene, herein designated GAM GENE, on one or more GAM1344 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18695] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1344 correlate with, and may be deduced from, the identity of the target genes which GAM1344 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18696] Nucleotide sequences of the GAM1344 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1344 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1344 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1344 are further described hereinbelow with reference to Table 1.

[18697] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1344 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18698] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1345 (GAM1345) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18699] GAM1345 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1345 was detected is described hereinabove with reference to Figs. 2-8.

[18700] GAM1345 gene, herein designated GAM GENE, and GAM1345 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18701] GAM1345 gene, herein designated GAM GENE, encodes a GAM1345 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1345 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1345 precursor RNA is designated SEQ ID:1322, and is provided hereinbelow with reference to the sequence listing part.

[18702] GAM1345 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18703] An enzyme complex designated DICER COMPLEX, dices the GAM1345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1345 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1345 RNA is designated SEQ ID:3926, and is provided hereinbelow with reference to the sequence listing part.

[18704] GAM1345 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1345 target RNA, herein designated GAM TARGET RNA. GAM1345 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18705] GAM1345 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1345 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1345 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1345 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1345 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18706] The complementary binding of GAM1345 RNA, herein designated GAM RNA, to target binding sites on GAM1345 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1345 target RNA, herein designated GAM TARGET RNA, into GAM1345 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18707] It is appreciated that GAM1345 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1345 target genes. The mRNA of each one of this plurality of GAM1345 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1345 RNA, herein designated GAM RNA, and which when bound by GAM1345 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1345 target proteins.

[18708] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1345 gene, herein designated GAM GENE, on one or more GAM1345 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18709] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1345 correlate with, and may be deduced from, the identity of the target

genes which GAM1345 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18710] Nucleotide sequences of the GAM1345 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1345 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1345 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1345 are further described hereinbelow with reference to Table 1.

[18711] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1345 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18712] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1346 (GAM1346) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18713] GAM1346 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1346 was detected is described hereinabove with reference to Figs. 2-8.

[18714] GAM1346 gene, herein designated GAM GENE, and GAM1346 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18715] GAM1346 gene, herein designated GAM GENE, encodes a GAM1346 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1346 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1346 precursor RNA is designated SEQ ID:1323, and is provided hereinbelow with reference to the sequence listing part.

[18716] GAM1346 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18717] An enzyme complex designated DICER COMPLEX, dices the GAM1346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1346 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1346 RNA is designated SEQ ID:3928, and is provided

hereinbelow with reference to the sequence listing part.

[18718] GAM1346 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1346 target RNA, herein designated GAM TARGET RNA. GAM1346 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18719] GAM1346 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1346 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1346 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1346 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1346 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18720] The complementary binding of GAM1346 RNA, herein designated GAM RNA, to target binding sites on GAM1346 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1346 target RNA, herein designated GAM TARGET RNA, into GAM1346 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18721] It is appreciated that GAM1346 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1346 target genes. The mRNA of each one of this plurality of GAM1346 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1346 RNA, herein designated GAM RNA, and which when bound by GAM1346 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1346 target proteins.

[18722] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1346 gene, herein designated GAM GENE, on one or more GAM1346 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18723] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1346 correlate with, and may be deduced from, the identity of the target genes which GAM1346 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18724] Nucleotide sequences of the GAM1346 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1346 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1346 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1346 are further described hereinbelow with reference to Table 1.

[18725] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1346 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18726] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1347 (GAM1347) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18727] GAM1347 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1347 was detected is described hereinabove with reference to Figs. 2-8.

[18728] GAM1347 gene, herein designated GAM GENE, and GAM1347 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18729] GAM1347 gene, herein designated GAM GENE, encodes a GAM1347 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1347 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1347 precursor RNA is designated SEQ ID:1324, and is provided hereinbelow with reference to the sequence listing part.

[18730] GAM1347 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18731] An enzyme complex designated DICER COMPLEX, dices the GAM1347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1347 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1347 RNA is designated SEQ ID:3929, and is provided hereinbelow with reference to the sequence listing part.

[18732] GAM1347 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1347 target RNA, herein designated GAM TARGET RNA. GAM1347 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18733] GAM1347 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1347 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1347 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1347 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1347 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18734] The complementary binding of GAM1347 RNA, herein designated GAM RNA, to target binding sites on GAM1347 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1347 target RNA, herein designated GAM TARGET RNA, into GAM1347 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18735] It is appreciated that GAM1347 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1347 target genes. The mRNA of each one of this plurality of GAM1347 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1347 RNA, herein designated GAM RNA, and which when bound by GAM1347 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1347 target proteins.

[18736] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1347 gene, herein designated GAM GENE, on one or more GAM1347 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18737] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1347 correlate with, and may be deduced from, the identity of the target genes which GAM1347 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18738] Nucleotide sequences of the GAM1347 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1347 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1347 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1347 are further described hereinbelow with reference to Table 1.

[18739] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1347 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18740] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1348 (GAM1348) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18741] GAM1348 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1348 was detected is described hereinabove with reference to Figs. 2-8.

[18742] GAM1348 gene, herein designated GAM GENE, and GAM1348 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18743] GAM1348 gene, herein designated GAM GENE, encodes a GAM1348 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1348 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1348 precursor RNA is designated SEQ ID:1325, and is provided hereinbelow with reference to the sequence listing part.

[18744] GAM1348 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18745] An enzyme complex designated DICER COMPLEX, dices the GAM1348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1348 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1348 RNA is designated SEQ ID:3930, and is provided hereinbelow with reference to the sequence listing part.

[18746] GAM1348 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1348 target RNA, herein designated GAM TARGET RNA. GAM1348 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18747] GAM1348 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1348 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1348 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1348 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1348 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18748] The complementary binding of GAM1348 RNA, herein designated GAM RNA, to target binding sites on GAM1348 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1348 target RNA, herein designated GAM TARGET RNA, into GAM1348 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18749] It is appreciated that GAM1348 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1348 target genes. The mRNA of each one of this plurality of GAM1348 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1348 RNA, herein designated GAM RNA, and which when bound by GAM1348 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1348 target proteins.

[18750] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1348 gene, herein designated GAM GENE, on one or more GAM1348 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18751] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1348 correlate with, and may be deduced from, the identity of the target genes which GAM1348 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18752] Nucleotide sequences of the GAM1348 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1348 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1348 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1348 are further described hereinbelow with reference to Table 1.

[18753] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1348 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18754] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1349 (GAM1349) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18755] GAM1349 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1349 was detected is described hereinabove with reference to Figs. 2-8.

[18756] GAM1349 gene, herein designated GAM GENE, and GAM1349 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18757] GAM1349 gene, herein designated GAM GENE, encodes a GAM1349 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1349 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1349 precursor RNA is designated SEQ ID:1326, and is provided hereinbelow with reference to the sequence listing part.

[18758] GAM1349 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18759] An enzyme complex designated DICER COMPLEX, dices the GAM1349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1349 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1349 RNA is designated SEQ ID:3931, and is provided hereinbelow with reference to the sequence listing part.

[18760] GAM1349 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1349 target RNA, herein designated GAM TARGET RNA. GAM1349 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18761] GAM1349 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1349 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1349 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1349 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1349 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18762] The complementary binding of GAM1349 RNA, herein designated GAM RNA, to target binding sites on GAM1349 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1349 target RNA, herein designated GAM TARGET RNA, into GAM1349 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18763] It is appreciated that GAM1349 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1349 target genes. The mRNA of each one of this plurality of GAM1349 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1349 RNA, herein designated GAM RNA, and which when bound by GAM1349 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1349 target proteins.

[18764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1349 gene, herein designated GAM GENE, on one or more GAM1349 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18765] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1349 correlate with, and may be deduced from, the identity of the target genes which GAM1349 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18766] Nucleotide sequences of the GAM1349 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1349 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1349 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1349 are further described hereinbelow with reference to Table 1.

[18767] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1349 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18768] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1350 (GAM1350) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18769] GAM1350 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1350 was detected is described hereinabove with reference to Figs. 2-8.

[18770] GAM1350 gene, herein designated GAM GENE, and GAM1350 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18771] GAM1350 gene, herein designated GAM GENE, encodes a GAM1350 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1350 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1350 precursor RNA is designated SEQ ID:1327, and is provided hereinbelow with reference to the sequence listing part.

[18772] GAM1350 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18773] An enzyme complex designated DICER COMPLEX, dices the GAM1350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1350 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1350 RNA is designated SEQ ID:3932, and is provided hereinbelow with reference to the sequence listing part.

[18774] GAM1350 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1350 target RNA, herein designated GAM TARGET RNA. GAM1350 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18775] GAM1350 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1350 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1350 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1350 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1350 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18776] The complementary binding of GAM1350 RNA, herein designated GAM RNA, to target binding sites on GAM1350 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1350 target RNA, herein designated GAM TARGET RNA, into GAM1350 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18777] It is appreciated that GAM1350 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1350 target genes. The

mRNA of each one of this plurality of GAM1350 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1350 RNA, herein designated GAM RNA, and which when bound by GAM1350 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1350 target proteins.

[18778] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1350 gene, herein designated GAM GENE, on one or more GAM1350 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18779] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1350 correlate with, and may be deduced from, the identity of the target genes which GAM1350 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18780] Nucleotide sequences of the GAM1350 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1350 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1350 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1350 are further described hereinbelow with reference to Table 1.

[18781] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1350 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18782] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1351 (GAM1351) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18783] GAM1351 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1351 was detected is described hereinabove with reference to Figs. 2-8.

[18784] GAM1351 gene, herein designated GAM GENE, and GAM1351 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18785] GAM1351 gene, herein designated GAM GENE, encodes a GAM1351 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1351 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1351 precursor RNA is designated SEQ ID:1328, and is provided hereinbelow with reference to the sequence listing part.

[18786] GAM1351 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18787] An enzyme complex designated DICER COMPLEX, dices the GAM1351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1351 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1351 RNA is designated SEQ ID:3933, and is provided hereinbelow with reference to the sequence listing part.

[18788] GAM1351 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1351 target RNA, herein designated GAM TARGET RNA. GAM1351 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18789] GAM1351 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1351 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1351 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1351 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1351 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18790] The complementary binding of GAM1351 RNA, herein designated GAM RNA, to target binding sites on GAM1351 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1351 target RNA, herein designated GAM TARGET RNA, into GAM1351 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18791] It is appreciated that GAM1351 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1351 target genes. The mRNA of each one of this plurality of GAM1351 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1351 RNA, herein designated GAM RNA, and which when bound by GAM1351 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1351 target proteins.

[18792] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1351 gene, herein designated GAM GENE, on one or more GAM1351 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18793] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1351 correlate with, and may be deduced from, the identity of the target

genes which GAM1351 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18794] Nucleotide sequences of the GAM1351 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1351 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1351 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1351 are further described hereinbelow with reference to Table 1.

[18795] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1351 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18796] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1352 (GAM1352) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18797] GAM1352 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1352 was detected is described hereinabove with reference to Figs. 2-8.

[18798] GAM1352 gene, herein designated GAM GENE, and GAM1352 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18799] GAM1352 gene, herein designated GAM GENE, encodes a GAM1352 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1352 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1352 precursor RNA is designated SEQ ID:1329, and is provided hereinbelow with reference to the sequence listing part.

[18800] GAM1352 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18801] An enzyme complex designated DICER COMPLEX, dices the GAM1352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1352 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1352 RNA is designated SEQ ID:3934, and is provided

hereinbelow with reference to the sequence listing part.

[18802] GAM1352 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1352 target RNA, herein designated GAM TARGET RNA. GAM1352 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18803] GAM1352 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1352 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1352 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1352 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1352 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18804] The complementary binding of GAM1352 RNA, herein designated GAM RNA, to target binding sites on GAM1352 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1352 target RNA, herein designated GAM TARGET RNA, into GAM1352 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18805] It is appreciated that GAM1352 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1352 target genes. The mRNA of each one of this plurality of GAM1352 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1352 RNA, herein designated GAM RNA, and which when bound by GAM1352 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1352 target proteins.

[18806] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1352 gene, herein designated GAM GENE, on one or more GAM1352 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18807] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1352 correlate with, and may be deduced from, the identity of the target genes which GAM1352 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18808] Nucleotide sequences of the GAM1352 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1352 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1352 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1352 are further described hereinbelow with reference to Table 1.

[18809] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1352 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18810] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1353 (GAM1353) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18811] GAM1353 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1353 was detected is described hereinabove with reference to Figs. 2-8.

[18812] GAM1353 gene, herein designated GAM GENE, and GAM1353 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18813] GAM1353 gene, herein designated GAM GENE, encodes a GAM1353 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1353 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1353 precursor RNA is designated SEQ ID:1330, and is provided hereinbelow with reference to the sequence listing part.

[18814] GAM1353 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18815] An enzyme complex designated DICER COMPLEX, dices the GAM1353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1353 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1353 RNA is designated SEQ ID:3935, and is provided hereinbelow with reference to the sequence listing part.

[18816] GAM1353 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1353 target RNA, herein designated GAM TARGET RNA. GAM1353 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18817] GAM1353 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1353 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1353 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1353 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1353 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18818] The complementary binding of GAM1353 RNA, herein designated GAM RNA, to target binding sites on GAM1353 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1353 target RNA, herein designated GAM TARGET RNA, into GAM1353 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18819] It is appreciated that GAM1353 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1353 target genes. The mRNA of each one of this plurality of GAM1353 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1353 RNA, herein designated GAM RNA, and which when bound by GAM1353 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1353 target proteins.

[18820] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1353 gene, herein designated GAM GENE, on one or more GAM1353 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18821] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1353 correlate with, and may be deduced from, the identity of the target genes which GAM1353 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18822] Nucleotide sequences of the GAM1353 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1353 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1353 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1353 are further described hereinbelow with reference to Table 1.

[18823] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1353 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18824] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1354 (GAM1354) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18825] GAM1354 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1354 was detected is described hereinabove with reference to Figs. 2-8.

[18826] GAM1354 gene, herein designated GAM GENE, and GAM1354 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18827] GAM1354 gene, herein designated GAM GENE, encodes a GAM1354 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1354 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1354 precursor RNA is designated SEQ ID:1331, and is provided hereinbelow with reference to the sequence listing part.

[18828] GAM1354 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18829] An enzyme complex designated DICER COMPLEX, dices the GAM1354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1354 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1354 RNA is designated SEQ ID:3936, and is provided hereinbelow with reference to the sequence listing part.

[18830] GAM1354 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1354 target RNA, herein designated GAM TARGET RNA. GAM1354 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18831] GAM1354 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1354 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1354 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1354 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1354 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18832] The complementary binding of GAM1354 RNA, herein designated GAM RNA, to target binding sites on GAM1354 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1354 target RNA, herein designated GAM TARGET RNA, into GAM1354 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18833] It is appreciated that GAM1354 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1354 target genes. The mRNA of each one of this plurality of GAM1354 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1354 RNA, herein designated GAM RNA, and which when bound by GAM1354 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1354 target proteins.

[18834] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1354 gene, herein designated GAM GENE, on one or more GAM1354 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18835] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1354 correlate with, and may be deduced from, the identity of the target genes which GAM1354 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18836] Nucleotide sequences of the GAM1354 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1354 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1354 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1354 are further described hereinbelow with reference to Table 1.

[18837] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1354 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18838] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1355 (GAM1355) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18839] GAM1355 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1355 was detected is described hereinabove with reference to Figs. 2-8.

[18840] GAM1355 gene, herein designated GAM GENE, and GAM1355 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18841] GAM1355 gene, herein designated GAM GENE, encodes a GAM1355 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1355 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1355 precursor RNA is designated SEQ ID:1332, and is provided hereinbelow with reference to the sequence listing part.

[18842] GAM1355 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18843] An enzyme complex designated DICER COMPLEX, dices the GAM1355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1355 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1355 RNA is designated SEQ ID:3938, and is provided hereinbelow with reference to the sequence listing part.

[18844] GAM1355 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1355 target RNA, herein designated GAM TARGET RNA. GAM1355 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18845] GAM1355 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1355 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1355 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1355 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1355 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18846] The complementary binding of GAM1355 RNA, herein designated GAM RNA, to target binding sites on GAM1355 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1355 target RNA, herein designated GAM TARGET RNA, into GAM1355 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18847] It is appreciated that GAM1355 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1355 target genes. The mRNA of each one of this plurality of GAM1355 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1355 RNA, herein designated GAM RNA, and which when bound by GAM1355 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1355 target proteins.

[18848] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1355 gene, herein designated GAM GENE, on one or more GAM1355 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18849] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1355 correlate with, and may be deduced from, the identity of the target genes which GAM1355 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18850] Nucleotide sequences of the GAM1355 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1355 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1355 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1355 are further described hereinbelow with reference to Table 1.

[18851] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1355 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18852] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1356 (GAM1356) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18853] GAM1356 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1356 was detected is described hereinabove with reference to Figs. 2-8.

[18854] GAM1356 gene, herein designated GAM GENE, and GAM1356 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18855] GAM1356 gene, herein designated GAM GENE, encodes a GAM1356 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1356 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1356 precursor RNA is designated SEQ ID:1333, and is provided hereinbelow with reference to the sequence listing part.

[18856] GAM1356 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18857] An enzyme complex designated DICER COMPLEX, dices the GAM1356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1356 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1356 RNA is designated SEQ ID:3937, and is provided hereinbelow with reference to the sequence listing part.

[18858] GAM1356 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1356 target RNA, herein designated GAM TARGET RNA. GAM1356 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18859] GAM1356 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1356 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1356 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1356 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1356 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18860] The complementary binding of GAM1356 RNA, herein designated GAM RNA, to target binding sites on GAM1356 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1356 target RNA, herein designated GAM TARGET RNA, into GAM1356 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18861] It is appreciated that GAM1356 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1356 target genes. The

mRNA of each one of this plurality of GAM1356 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1356 RNA, herein designated GAM RNA, and which when bound by GAM1356 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1356 target proteins.

[18862] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1356 gene, herein designated GAM GENE, on one or more GAM1356 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18863] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1356 correlate with, and may be deduced from, the identity of the target genes which GAM1356 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18864] Nucleotide sequences of the GAM1356 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1356 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1356 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1356 are further described hereinbelow with reference to Table 1.

[18865] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1356 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18866] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1357 (GAM1357) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18867] GAM1357 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1357 was detected is described hereinabove with reference to Figs. 2-8.

[18868] GAM1357 gene, herein designated GAM GENE, and GAM1357 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18869] GAM1357 gene, herein designated GAM GENE, encodes a GAM1357 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1357 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1357 precursor RNA is designated SEQ ID:1334, and is provided hereinbelow with reference to the sequence listing part.

[18870] GAM1357 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18871] An enzyme complex designated DICER COMPLEX, dices the GAM1357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1357 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1357 RNA is designated SEQ ID:3939, and is provided hereinbelow with reference to the sequence listing part.

[18872] GAM1357 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1357 target RNA, herein designated GAM TARGET RNA. GAM1357 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18873] GAM1357 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1357 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1357 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1357 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1357 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18874] The complementary binding of GAM1357 RNA, herein designated GAM RNA, to target binding sites on GAM1357 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1357 target RNA, herein designated GAM TARGET RNA, into GAM1357 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18875] It is appreciated that GAM1357 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1357 target genes. The mRNA of each one of this plurality of GAM1357 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1357 RNA, herein designated GAM RNA, and which when bound by GAM1357 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1357 target proteins.

[18876] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1357 gene, herein designated GAM GENE, on one or more GAM1357 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18877] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1357 correlate with, and may be deduced from, the identity of the target

genes which GAM1357 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18878] Nucleotide sequences of the GAM1357 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1357 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1357 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1357 are further described hereinbelow with reference to Table 1.

[18879] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1357 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18880] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1358 (GAM1358) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18881] GAM1358 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1358 was detected is described hereinabove with reference to Figs. 2-8.

[18882] GAM1358 gene, herein designated GAM GENE, and GAM1358 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18883] GAM1358 gene, herein designated GAM GENE, encodes a GAM1358 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1358 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1358 precursor RNA is designated SEQ ID:1335, and is provided hereinbelow with reference to the sequence listing part.

[18884] GAM1358 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18885] An enzyme complex designated DICER COMPLEX, dices the GAM1358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1358 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1358 RNA is designated SEQ ID:3940, and is provided

hereinbelow with reference to the sequence listing part.

[18886] GAM1358 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1358 target RNA, herein designated GAM TARGET RNA. GAM1358 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18887] GAM1358 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1358 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1358 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1358 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1358 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18888] The complementary binding of GAM1358 RNA, herein designated GAM RNA, to target binding sites on GAM1358 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1358 target RNA, herein designated GAM TARGET RNA, into GAM1358 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18889] It is appreciated that GAM1358 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1358 target genes. The mRNA of each one of this plurality of GAM1358 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1358 RNA, herein designated GAM RNA, and which when bound by GAM1358 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1358 target proteins.

[18890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1358 gene, herein designated GAM GENE, on one or more GAM1358 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18891] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1358 correlate with, and may be deduced from, the identity of the target genes which GAM1358 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18892] Nucleotide sequences of the GAM1358 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1358 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1358 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1358 are further described hereinbelow with reference to Table 1.

[18893] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1358 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18894] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1359 (GAM1359) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18895] GAM1359 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1359 was detected is described hereinabove with reference to Figs. 2-8.

[18896] GAM1359 gene, herein designated GAM GENE, and GAM1359 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18897] GAM1359 gene, herein designated GAM GENE, encodes a GAM1359 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1359 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1359 precursor RNA is designated SEQ ID:1336, and is provided hereinbelow with reference to the sequence listing part.

[18898] GAM1359 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18899] An enzyme complex designated DICER COMPLEX, dices the GAM1359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1359 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1359 RNA is designated SEQ ID:3941, and is provided hereinbelow with reference to the sequence listing part.

[18900] GAM1359 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1359 target RNA, herein designated GAM TARGET RNA. GAM1359 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18901] GAM1359 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1359 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1359 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1359 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1359 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18902] The complementary binding of GAM1359 RNA, herein designated GAM RNA, to target binding sites on GAM1359 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1359 target RNA, herein designated GAM TARGET RNA, into GAM1359 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18903] It is appreciated that GAM1359 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1359 target genes. The mRNA of each one of this plurality of GAM1359 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1359 RNA, herein designated GAM RNA, and which when bound by GAM1359 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1359 target proteins.

[18904] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1359 gene, herein designated GAM GENE, on one or more GAM1359 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18905] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1359 correlate with, and may be deduced from, the identity of the target genes which GAM1359 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18906] Nucleotide sequences of the GAM1359 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1359 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1359 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1359 are further described hereinbelow with reference to Table 1.

[18907] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1359 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18908] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1360 (GAM1360) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18909] GAM1360 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1360 was detected is described hereinabove with reference to Figs. 2-8.

[18910] GAM1360 gene, herein designated GAM GENE, and GAM1360 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18911] GAM1360 gene, herein designated GAM GENE, encodes a GAM1360 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1360 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1360 precursor RNA is designated SEQ ID:1337, and is provided hereinbelow with reference to the sequence listing part.

[18912] GAM1360 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18913] An enzyme complex designated DICER COMPLEX, dices the GAM1360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1360 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1360 RNA is designated SEQ ID:3942, and is provided hereinbelow with reference to the sequence listing part.

[18914] GAM1360 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1360 target RNA, herein designated GAM TARGET RNA. GAM1360 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18915] GAM1360 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1360 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1360 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1360 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1360 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18916] The complementary binding of GAM1360 RNA, herein designated GAM RNA, to target binding sites on GAM1360 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1360 target RNA, herein designated GAM TARGET RNA, into GAM1360 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18917] It is appreciated that GAM1360 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1360 target genes. The mRNA of each one of this plurality of GAM1360 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1360 RNA, herein designated GAM RNA, and which when bound by GAM1360 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1360 target proteins.

[18918] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1360 gene, herein designated GAM GENE, on one or more GAM1360 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18919] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1360 correlate with, and may be deduced from, the identity of the target genes which GAM1360 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18920] Nucleotide sequences of the GAM1360 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1360 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1360 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1360 are further described hereinbelow with reference to Table 1.

[18921] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1360 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[18922] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1361 (GAM1361) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18923] GAM1361 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1361 was detected is described hereinabove with reference to Figs. 2-8.

[18924] GAM1361 gene, herein designated GAM GENE, and GAM1361 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18925] GAM1361 gene, herein designated GAM GENE, encodes a GAM1361 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1361 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1361 precursor RNA is designated SEQ ID:1338, and is provided hereinbelow with reference to the sequence listing part.

[18926] GAM1361 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18927] An enzyme complex designated DICER COMPLEX, dices the GAM1361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1361 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1361 RNA is designated SEQ ID:3944, and is provided hereinbelow with reference to the sequence listing part.

[18928] GAM1361 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1361 target RNA, herein designated GAM TARGET RNA. GAM1361 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18929] GAM1361 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1361 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1361 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1361 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1361 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18930] The complementary binding of GAM1361 RNA, herein designated GAM RNA, to target binding sites on GAM1361 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1361 target RNA, herein designated GAM TARGET RNA, into GAM1361 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18931] It is appreciated that GAM1361 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1361 target genes. The mRNA of each one of this plurality of GAM1361 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1361 RNA, herein designated GAM RNA, and which when bound by GAM1361 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1361 target proteins.

[18932] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1361 gene, herein designated GAM GENE, on one or more GAM1361 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18933] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1361 correlate with, and may be deduced from, the identity of the target genes which GAM1361 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18934] Nucleotide sequences of the GAM1361 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1361 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1361 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1361 are further described hereinbelow with reference to Table 1.

[18935] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1361 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18936] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1362 (GAM1362) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18937] GAM1362 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1362 was detected is described hereinabove with reference to Figs. 2-8.

[18938] GAM1362 gene, herein designated GAM GENE, and GAM1362 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18939] GAM1362 gene, herein designated GAM GENE, encodes a GAM1362 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1362 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1362 precursor RNA is designated SEQ ID:1339, and is provided hereinbelow with reference to the sequence listing part.

[18940] GAM1362 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18941] An enzyme complex designated DICER COMPLEX, dices the GAM1362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1362 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1362 RNA is designated SEQ ID:3943, and is provided hereinbelow with reference to the sequence listing part.

[18942] GAM1362 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1362 target RNA, herein designated GAM TARGET RNA. GAM1362 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18943] GAM1362 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1362 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1362 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1362 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1362 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18944] The complementary binding of GAM1362 RNA, herein designated GAM RNA, to target binding sites on GAM1362 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1362 target RNA, herein designated GAM TARGET RNA, into GAM1362 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18945] It is appreciated that GAM1362 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1362 target genes. The

mRNA of each one of this plurality of GAM1362 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1362 RNA, herein designated GAM RNA, and which when bound by GAM1362 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1362 target proteins.

[18946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1362 gene, herein designated GAM GENE, on one or more GAM1362 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18947] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1362 correlate with, and may be deduced from, the identity of the target genes which GAM1362 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18948] Nucleotide sequences of the GAM1362 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1362 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1362 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1362 are further described hereinbelow with reference to Table 1.

[18949] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1362 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18950] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1363 (GAM1363) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18951] GAM1363 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1363 was detected is described hereinabove with reference to Figs. 2-8.

[18952] GAM1363 gene, herein designated GAM GENE, and GAM1363 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18953] GAM1363 gene, herein designated GAM GENE, encodes a GAM1363 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1363 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1363 precursor RNA is designated SEQ ID:1340, and is provided hereinbelow with reference to the sequence listing part.

[18954] GAM1363 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18955] An enzyme complex designated DICER COMPLEX, dices the GAM1363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1363 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1363 RNA is designated SEQ ID:3945, and is provided hereinbelow with reference to the sequence listing part.

[18956] GAM1363 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1363 target RNA, herein designated GAM TARGET RNA. GAM1363 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18957] GAM1363 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1363 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1363 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1363 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1363 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18958] The complementary binding of GAM1363 RNA, herein designated GAM RNA, to target binding sites on GAM1363 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1363 target RNA, herein designated GAM TARGET RNA, into GAM1363 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18959] It is appreciated that GAM1363 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1363 target genes. The mRNA of each one of this plurality of GAM1363 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1363 RNA, herein designated GAM RNA, and which when bound by GAM1363 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1363 target proteins.

[18960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1363 gene, herein designated GAM GENE, on one or more GAM1363 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18961] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1363 correlate with, and may be deduced from, the identity of the target

genes which GAM1363 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18962] Nucleotide sequences of the GAM1363 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1363 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1363 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1363 are further described hereinbelow with reference to Table 1.

[18963] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1363 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18964] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1364 (GAM1364) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18965] GAM1364 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1364 was detected is described hereinabove with reference to Figs. 2-8.

[18966] GAM1364 gene, herein designated GAM GENE, and GAM1364 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[18967] GAM1364 gene, herein designated GAM GENE, encodes a GAM1364 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1364 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1364 precursor RNA is designated SEQ ID:1341, and is provided hereinbelow with reference to the sequence listing part.

[18968] GAM1364 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18969] An enzyme complex designated DICER COMPLEX, dices the GAM1364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1364 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1364 RNA is designated SEQ ID:3946, and is provided

hereinbelow with reference to the sequence listing part.

[18970] GAM1364 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1364 target RNA, herein designated GAM TARGET RNA. GAM1364 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18971] GAM1364 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1364 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1364 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1364 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1364 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18972] The complementary binding of GAM1364 RNA, herein designated GAM RNA, to target binding sites on GAM1364 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1364 target RNA, herein designated GAM TARGET RNA, into GAM1364 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18973] It is appreciated that GAM1364 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1364 target genes. The mRNA of each one of this plurality of GAM1364 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1364 RNA, herein designated GAM RNA, and which when bound by GAM1364 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1364 target proteins.

[18974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1364 gene, herein designated GAM GENE, on one or more GAM1364 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18975] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1364 correlate with, and may be deduced from, the identity of the target genes which GAM1364 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18976] Nucleotide sequences of the GAM1364 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1364 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1364 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1364 are further described hereinbelow with reference to Table 1.

[18977] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1364 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18978] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1365 (GAM1365) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18979] GAM1365 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1365 was detected is described hereinabove with reference to Figs. 2-8.

[18980] GAM1365 gene, herein designated GAM GENE, and GAM1365 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18981] GAM1365 gene, herein designated GAM GENE, encodes a GAM1365 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1365 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1365 precursor RNA is designated SEQ ID:1342, and is provided hereinbelow with reference to the sequence listing part.

[18982] GAM1365 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18983] An enzyme complex designated DICER COMPLEX, dices the GAM1365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1365 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1365 RNA is designated SEQ ID:3947, and is provided hereinbelow with reference to the sequence listing part.

[18984] GAM1365 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1365 target RNA, herein designated GAM TARGET RNA. GAM1365 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18985] GAM1365 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1365 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1365 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1365 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1365 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18986] The complementary binding of GAM1365 RNA, herein designated GAM RNA, to target binding sites on GAM1365 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1365 target RNA, herein designated GAM TARGET RNA, into GAM1365 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[18987] It is appreciated that GAM1365 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1365 target genes. The mRNA of each one of this plurality of GAM1365 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1365 RNA, herein designated GAM RNA, and which when bound by GAM1365 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1365 target proteins.

[18988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1365 gene, herein designated GAM GENE, on one or more GAM1365 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18989] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1365 correlate with, and may be deduced from, the identity of the target genes which GAM1365 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18990] Nucleotide sequences of the GAM1365 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1365 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1365 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1365 are further described hereinbelow with reference to Table 1.

[18991] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1365 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[18992] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1366 (GAM1366) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[18993] GAM1366 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1366 was detected is described hereinabove with reference to Figs. 2-8.

[18994] GAM1366 gene, herein designated GAM GENE, and GAM1366 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[18995] GAM1366 gene, herein designated GAM GENE, encodes a GAM1366 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1366 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1366 precursor RNA is designated SEQ ID:1343, and is provided hereinbelow with reference to the sequence listing part.

[18996] GAM1366 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18997] An enzyme complex designated DICER COMPLEX, dices the GAM1366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1366 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1366 RNA is designated SEQ ID:3948, and is provided hereinbelow with reference to the sequence listing part.

[18998] GAM1366 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1366 target RNA, herein designated GAM TARGET RNA. GAM1366 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18999] GAM1366 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1366 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1366 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1366 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1366 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19000] The complementary binding of GAM1366 RNA, herein designated GAM RNA, to target binding sites on GAM1366 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1366 target RNA, herein designated GAM TARGET RNA, into GAM1366 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19001] It is appreciated that GAM1366 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1366 target genes. The mRNA of each one of this plurality of GAM1366 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1366 RNA, herein designated GAM RNA, and which when bound by GAM1366 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1366 target proteins.

[19002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1366 gene, herein designated GAM GENE, on one or more GAM1366 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19003] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1366 correlate with, and may be deduced from, the identity of the target genes which GAM1366 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19004] Nucleotide sequences of the GAM1366 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1366 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1366 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1366 are further described hereinbelow with reference to Table 1.

[19005] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1366 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19006] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1367 (GAM1367) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19007] GAM1367 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1367 was detected is described hereinabove with reference to Figs. 2-8.

[19008] GAM1367 gene, herein designated GAM GENE, and GAM1367 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19009] GAM1367 gene, herein designated GAM GENE, encodes a GAM1367 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1367 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1367 precursor RNA is designated SEQ ID:1344, and is provided hereinbelow with reference to the sequence listing part.

[19010] GAM1367 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19011] An enzyme complex designated DICER COMPLEX, dices the GAM1367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1367 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1367 RNA is designated SEQ ID:3949, and is provided hereinbelow with reference to the sequence listing part.

[19012] GAM1367 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1367 target RNA, herein designated GAM TARGET RNA. GAM1367 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19013] GAM1367 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1367 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1367 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1367 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1367 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19014] The complementary binding of GAM1367 RNA, herein designated GAM RNA, to target binding sites on GAM1367 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1367 target RNA, herein designated GAM TARGET RNA, into GAM1367 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19015] It is appreciated that GAM1367 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1367 target genes. The mRNA of each one of this plurality of GAM1367 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1367 RNA, herein designated GAM RNA, and which when bound by GAM1367 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1367 target proteins.

[19016] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1367 gene, herein designated GAM GENE, on one or more GAM1367 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19017] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1367 correlate with, and may be deduced from, the identity of the target genes which GAM1367 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19018] Nucleotide sequences of the GAM1367 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1367 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1367 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1367 are further described hereinbelow with reference to Table 1.

[19019] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1367 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19020] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1368 (GAM1368) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19021] GAM1368 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1368 was detected is described hereinabove with reference to Figs. 2-8.

[19022] GAM1368 gene, herein designated GAM GENE, and GAM1368 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19023] GAM1368 gene, herein designated GAM GENE, encodes a GAM1368 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1368 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1368 precursor RNA is designated SEQ ID:1345, and is provided hereinbelow with reference to the sequence listing part.

[19024] GAM1368 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19025] An enzyme complex designated DICER COMPLEX, dices the GAM1368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1368 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1368 RNA is designated SEQ ID:3950, and is provided hereinbelow with reference to the sequence listing part.

[19026] GAM1368 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1368 target RNA, herein designated GAM TARGET RNA. GAM1368 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19027] GAM1368 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1368 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1368 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1368 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1368 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19028] The complementary binding of GAM1368 RNA, herein designated GAM RNA, to target binding sites on GAM1368 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1368 target RNA, herein designated GAM TARGET RNA, into GAM1368 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19029] It is appreciated that GAM1368 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1368 target genes. The

mRNA of each one of this plurality of GAM1368 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1368 RNA, herein designated GAM RNA, and which when bound by GAM1368 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1368 target proteins.

[19030] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1368 gene, herein designated GAM GENE, on one or more GAM1368 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19031] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1368 correlate with, and may be deduced from, the identity of the target genes which GAM1368 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19032] Nucleotide sequences of the GAM1368 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1368 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1368 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1368 are further described hereinbelow with reference to Table 1.

[19033] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1368 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19034] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1369 (GAM1369) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19035] GAM1369 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1369 was detected is described hereinabove with reference to Figs. 2-8.

[19036] GAM1369 gene, herein designated GAM GENE, and GAM1369 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19037] GAM1369 gene, herein designated GAM GENE, encodes a GAM1369 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1369 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1369 precursor RNA is designated SEQ ID:1346, and is provided hereinbelow with reference to the sequence listing part.

[19038] GAM1369 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19039] An enzyme complex designated DICER COMPLEX, dices the GAM1369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1369 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM1369 RNA is designated SEQ ID:3951, and is provided hereinbelow with reference to the sequence listing part.

[19040] GAM1369 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1369 target RNA, herein designated GAM TARGET RNA. GAM1369 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19041] GAM1369 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1369 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1369 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1369 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1369 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19042] The complementary binding of GAM1369 RNA, herein designated GAM RNA, to target binding sites on GAM1369 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1369 target RNA, herein designated GAM TARGET RNA, into GAM1369 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19043] It is appreciated that GAM1369 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1369 target genes. The mRNA of each one of this plurality of GAM1369 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1369 RNA, herein designated GAM RNA, and which when bound by GAM1369 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1369 target proteins.

[19044] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1369 gene, herein designated GAM GENE, on one or more GAM1369 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19045] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1369 correlate with, and may be deduced from, the identity of the target

genes which GAM1369 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19046] Nucleotide sequences of the GAM1369 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1369 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1369 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1369 are further described hereinbelow with reference to Table 1.

[19047] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1369 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19048] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1370 (GAM1370) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19049] GAM1370 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1370 was detected is described hereinabove with reference to Figs. 2-8.

[19050] GAM1370 gene, herein designated GAM GENE, and GAM1370 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19051] GAM1370 gene, herein designated GAM GENE, encodes a GAM1370 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1370 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1370 precursor RNA is designated SEQ ID:1347, and is provided hereinbelow with reference to the sequence listing part.

[19052] GAM1370 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19053] An enzyme complex designated DICER COMPLEX, dices the GAM1370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1370 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1370 RNA is designated SEQ ID:3952, and is provided

hereinbelow with reference to the sequence listing part.

[19054] GAM1370 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1370 target RNA, herein designated GAM TARGET RNA. GAM1370 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19055] GAM1370 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1370 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1370 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1370 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1370 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19056] The complementary binding of GAM1370 RNA, herein designated GAM RNA, to target binding sites on GAM1370 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1370 target RNA, herein designated GAM TARGET RNA, into GAM1370 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19057] It is appreciated that GAM1370 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1370 target genes. The mRNA of each one of this plurality of GAM1370 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1370 RNA, herein designated GAM RNA, and which when bound by GAM1370 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1370 target proteins.

[19058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1370 gene, herein designated GAM GENE, on one or more GAM1370 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19059] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1370 correlate with, and may be deduced from, the identity of the target genes which GAM1370 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19060] Nucleotide sequences of the GAM1370 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1370 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1370 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1370 are further described hereinbelow with reference to Table 1.

[19061] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1370 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19062] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1371 (GAM1371) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19063] GAM1371 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1371 was detected is described hereinabove with reference to Figs. 2-8.

[19064] GAM1371 gene, herein designated GAM GENE, and GAM1371 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19065] GAM1371 gene, herein designated GAM GENE, encodes a GAM1371 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1371 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1371 precursor RNA is designated SEQ ID:1348, and is provided hereinbelow with reference to the sequence listing part.

[19066] GAM1371 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19067] An enzyme complex designated DICER COMPLEX, dices the GAM1371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1371 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1371 RNA is designated SEQ ID:3953, and is provided hereinbelow with reference to the sequence listing part.

[19068] GAM1371 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1371 target RNA, herein designated GAM TARGET RNA. GAM1371 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19069] GAM1371 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1371 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1371 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1371 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1371 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19070] The complementary binding of GAM1371 RNA, herein designated GAM RNA, to target binding sites on GAM1371 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1371 target RNA, herein designated GAM TARGET RNA, into GAM1371 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19071] It is appreciated that GAM1371 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1371 target genes. The mRNA of each one of this plurality of GAM1371 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1371 RNA, herein designated GAM RNA, and which when bound by GAM1371 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1371 target proteins.

[19072] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1371 gene, herein designated GAM GENE, on one or more GAM1371 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19073] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1371 correlate with, and may be deduced from, the identity of the target genes which GAM1371 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19074] Nucleotide sequences of the GAM1371 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1371 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1371 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1371 are further described hereinbelow with reference to Table 1.

[19075] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1371 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19076] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1372 (GAM1372) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19077] GAM1372 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1372 was detected is described hereinabove with reference to Figs. 2-8.

[19078] GAM1372 gene, herein designated GAM GENE, and GAM1372 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19079] GAM1372 gene, herein designated GAM GENE, encodes a GAM1372 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1372 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1372 precursor RNA is designated SEQ ID:1349, and is provided hereinbelow with reference to the sequence listing part.

[19080] GAM1372 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19081] An enzyme complex designated DICER COMPLEX, dices the GAM1372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1372 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1372 RNA is designated SEQ ID:3954, and is provided hereinbelow with reference to the sequence listing part.

[19082] GAM1372 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1372 target RNA, herein designated GAM TARGET RNA. GAM1372 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19083] GAM1372 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1372 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1372 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1372 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1372 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19084] The complementary binding of GAM1372 RNA, herein designated GAM RNA, to target binding sites on GAM1372 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1372 target RNA, herein designated GAM TARGET RNA, into GAM1372 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19085] It is appreciated that GAM1372 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1372 target genes. The mRNA of each one of this plurality of GAM1372 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1372 RNA, herein designated GAM RNA, and which when bound by GAM1372 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1372 target proteins.

[19086] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1372 gene, herein designated GAM GENE, on one or more GAM1372 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19087] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1372 correlate with, and may be deduced from, the identity of the target genes which GAM1372 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19088] Nucleotide sequences of the GAM1372 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1372 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1372 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1372 are further described hereinbelow with reference to Table 1.

[19089] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1372 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19090] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1373 (GAM1373) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19091] GAM1373 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1373 was detected is described hereinabove with reference to Figs. 2-8.

[19092] GAM1373 gene, herein designated GAM GENE, and GAM1373 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19093] GAM1373 gene, herein designated GAM GENE, encodes a GAM1373 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1373 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1373 precursor RNA is designated SEQ ID:1350, and is provided hereinbelow with reference to the sequence listing part.

[19094] GAM1373 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19095] An enzyme complex designated DICER COMPLEX, dices the GAM1373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1373 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1373 RNA is designated SEQ ID:3955, and is provided hereinbelow with reference to the sequence listing part.

[19096] GAM1373 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1373 target RNA, herein designated GAM TARGET RNA. GAM1373 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19097] GAM1373 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1373 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1373 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1373 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1373 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19098] The complementary binding of GAM1373 RNA, herein designated GAM RNA, to target binding sites on GAM1373 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1373 target RNA, herein designated GAM TARGET RNA, into GAM1373 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19099] It is appreciated that GAM1373 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1373 target genes. The mRNA of each one of this plurality of GAM1373 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1373 RNA, herein designated GAM RNA, and which when bound by GAM1373 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1373 target proteins.

[19100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1373 gene, herein designated GAM GENE, on one or more GAM1373 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19101] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1373 correlate with, and may be deduced from, the identity of the target genes which GAM1373 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19102] Nucleotide sequences of the GAM1373 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1373 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1373 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1373 are further described hereinbelow with reference to Table 1.

[19103] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1373 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19104] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1374 (GAM1374) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19105] GAM1374 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1374 was detected is described hereinabove with reference to Figs. 2-8.

[19106] GAM1374 gene, herein designated GAM GENE, and GAM1374 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19107] GAM1374 gene, herein designated GAM GENE, encodes a GAM1374 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1374 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1374 precursor RNA is designated SEQ ID:1351, and is provided hereinbelow with reference to the sequence listing part.

[19108] GAM1374 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19109] An enzyme complex designated DICER COMPLEX, dices the GAM1374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1374 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1374 RNA is designated SEQ ID:3956, and is provided hereinbelow with reference to the sequence listing part.

[19110] GAM1374 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1374 target RNA, herein designated GAM TARGET RNA. GAM1374 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19111] GAM1374 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1374 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1374 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1374 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1374 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19112] The complementary binding of GAM1374 RNA, herein designated GAM RNA, to target binding sites on GAM1374 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1374 target RNA, herein designated GAM TARGET RNA, into GAM1374 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19113] It is appreciated that GAM1374 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1374 target genes. The

mRNA of each one of this plurality of GAM1374 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1374 RNA, herein designated GAM RNA, and which when bound by GAM1374 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1374 target proteins.

[19114] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1374 gene, herein designated GAM GENE, on one or more GAM1374 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19115] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1374 correlate with, and may be deduced from, the identity of the target genes which GAM1374 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19116] Nucleotide sequences of the GAM1374 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1374 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1374 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1374 are further described hereinbelow with reference to Table 1.

[19117] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1374 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19118] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1375 (GAM1375) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19119] GAM1375 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1375 was detected is described hereinabove with reference to Figs. 2-8.

[19120] GAM1375 gene, herein designated GAM GENE, and GAM1375 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19121] GAM1375 gene, herein designated GAM GENE, encodes a GAM1375 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1375 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1375 precursor RNA is designated SEQ ID:1352, and is provided hereinbelow with reference to the sequence listing part.

[19122] GAM1375 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19123] An enzyme complex designated DICER COMPLEX, dices the GAM1375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1375 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1375 RNA is designated SEQ ID:3957, and is provided hereinbelow with reference to the sequence listing part.

[19124] GAM1375 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1375 target RNA, herein designated GAM TARGET RNA. GAM1375 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19125] GAM1375 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1375 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1375 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1375 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1375 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19126] The complementary binding of GAM1375 RNA, herein designated GAM RNA, to target binding sites on GAM1375 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1375 target RNA, herein designated GAM TARGET RNA, into GAM1375 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19127] It is appreciated that GAM1375 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1375 target genes. The mRNA of each one of this plurality of GAM1375 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1375 RNA, herein designated GAM RNA, and which when bound by GAM1375 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1375 target proteins.

[19128] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1375 gene, herein designated GAM GENE, on one or more GAM1375 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19129] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1375 correlate with, and may be deduced from, the identity of the target

genes which GAM1375 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19130] Nucleotide sequences of the GAM1375 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1375 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1375 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1375 are further described hereinbelow with reference to Table 1.

[19131] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1375 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19132] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1376 (GAM1376) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19133] GAM1376 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1376 was detected is described hereinabove with reference to Figs. 2-8.

[19134] GAM1376 gene, herein designated GAM GENE, and GAM1376 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19135] GAM1376 gene, herein designated GAM GENE, encodes a GAM1376 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1376 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1376 precursor RNA is designated SEQ ID:1353, and is provided hereinbelow with reference to the sequence listing part.

[19136] GAM1376 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19137] An enzyme complex designated DICER COMPLEX, dices the GAM1376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1376 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1376 RNA is designated SEQ ID:3958, and is provided

hereinbelow with reference to the sequence listing part.

[19138] GAM1376 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1376 target RNA, herein designated GAM TARGET RNA. GAM1376 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19139] GAM1376 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1376 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1376 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1376 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1376 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19140] The complementary binding of GAM1376 RNA, herein designated GAM RNA, to target binding sites on GAM1376 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1376 target RNA, herein designated GAM TARGET RNA, into GAM1376 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19141] It is appreciated that GAM1376 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1376 target genes. The mRNA of each one of this plurality of GAM1376 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1376 RNA, herein designated GAM RNA, and which when bound by GAM1376 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1376 target proteins.

[19142] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1376 gene, herein designated GAM GENE, on one or more GAM1376 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19143] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1376 correlate with, and may be deduced from, the identity of the target genes which GAM1376 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19144] Nucleotide sequences of the GAM1376 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1376 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1376 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1376 are further described hereinbelow with reference to Table 1.

[19145] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1376 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19146] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1377 (GAM1377) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19147] GAM1377 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1377 was detected is described hereinabove with reference to Figs. 2-8.

[19148] GAM1377 gene, herein designated GAM GENE, and GAM1377 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19149] GAM1377 gene, herein designated GAM GENE, encodes a GAM1377 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1377 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1377 precursor RNA is designated SEQ ID:1354, and is provided hereinbelow with reference to the sequence listing part.

[19150] GAM1377 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19151] An enzyme complex designated DICER COMPLEX, dices the GAM1377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1377 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1377 RNA is designated SEQ ID:3959, and is provided hereinbelow with reference to the sequence listing part.

[19152] GAM1377 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1377 target RNA, herein designated GAM TARGET RNA. GAM1377 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19153] GAM1377 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1377 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1377 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1377 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1377 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19154] The complementary binding of GAM1377 RNA, herein designated GAM RNA, to target binding sites on GAM1377 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1377 target RNA, herein designated GAM TARGET RNA, into GAM1377 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19155] It is appreciated that GAM1377 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1377 target genes. The mRNA of each one of this plurality of GAM1377 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1377 RNA, herein designated GAM RNA, and which when bound by GAM1377 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1377 target proteins.

[19156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1377 gene, herein designated GAM GENE, on one or more GAM1377 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19157] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1377 correlate with, and may be deduced from, the identity of the target genes which GAM1377 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19158] Nucleotide sequences of the GAM1377 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1377 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1377 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1377 are further described hereinbelow with reference to Table 1.

[19159] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1377 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19160] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1378 (GAM1378) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19161] GAM1378 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1378 was detected is described hereinabove with reference to Figs. 2-8.

[19162] GAM1378 gene, herein designated GAM GENE, and GAM1378 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19163] GAM1378 gene, herein designated GAM GENE, encodes a GAM1378 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1378 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1378 precursor RNA is designated SEQ ID:1355, and is provided hereinbelow with reference to the sequence listing part.

[19164] GAM1378 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19165] An enzyme complex designated DICER COMPLEX, dices the GAM1378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1378 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1378 RNA is designated SEQ ID:3960, and is provided hereinbelow with reference to the sequence listing part.

[19166] GAM1378 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1378 target RNA, herein designated GAM TARGET RNA. GAM1378 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19167] GAM1378 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1378 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1378 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1378 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1378 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19168] The complementary binding of GAM1378 RNA, herein designated GAM RNA, to target binding sites on GAM1378 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1378 target RNA, herein designated GAM TARGET RNA, into GAM1378 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19169] It is appreciated that GAM1378 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1378 target genes. The mRNA of each one of this plurality of GAM1378 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1378 RNA, herein designated GAM RNA, and which when bound by GAM1378 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1378 target proteins.

[19170] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1378 gene, herein designated GAM GENE, on one or more GAM1378 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19171] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1378 correlate with, and may be deduced from, the identity of the target genes which GAM1378 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19172] Nucleotide sequences of the GAM1378 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1378 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1378 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1378 are further described hereinbelow with reference to Table 1.

[19173] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1378 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19174] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1379 (GAM1379) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19175] GAM1379 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1379 was detected is described hereinabove with reference to Figs. 2-8.

[19176] GAM1379 gene, herein designated GAM GENE, and GAM1379 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19177] GAM1379 gene, herein designated GAM GENE, encodes a GAM1379 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1379 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1379 precursor RNA is designated SEQ ID:1356, and is provided hereinbelow with reference to the sequence listing part.

[19178] GAM1379 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19179] An enzyme complex designated DICER COMPLEX, dices the GAM1379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1379 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1379 RNA is designated SEQ ID:3961, and is provided hereinbelow with reference to the sequence listing part.

[19180] GAM1379 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1379 target RNA, herein designated GAM TARGET RNA. GAM1379 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19181] GAM1379 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1379 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1379 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1379 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1379 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19182] The complementary binding of GAM1379 RNA, herein designated GAM RNA, to target binding sites on GAM1379 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1379 target RNA, herein designated GAM TARGET RNA, into GAM1379 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19183] It is appreciated that GAM1379 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1379 target genes. The mRNA of each one of this plurality of GAM1379 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1379 RNA, herein designated GAM RNA, and which when bound by GAM1379 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1379 target proteins.

[19184] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1379 gene, herein designated GAM GENE, on one or more GAM1379 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19185] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1379 correlate with, and may be deduced from, the identity of the target genes which GAM1379 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19186] Nucleotide sequences of the GAM1379 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1379 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1379 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1379 are further described hereinbelow with reference to Table 1.

[19187] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1379 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19188] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1380 (GAM1380) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19189] GAM1380 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1380 was detected is described hereinabove with reference to Figs. 2-8.

[19190] GAM1380 gene, herein designated GAM GENE, and GAM1380 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19191] GAM1380 gene, herein designated GAM GENE, encodes a GAM1380 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1380 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1380 precursor RNA is designated SEQ ID:1357, and is provided hereinbelow with reference to the sequence listing part.

[19192] GAM1380 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19193] An enzyme complex designated DICER COMPLEX, dices the GAM1380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1380 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1380 RNA is designated SEQ ID:3962, and is provided hereinbelow with reference to the sequence listing part.

[19194] GAM1380 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1380 target RNA, herein designated GAM TARGET RNA. GAM1380 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19195] GAM1380 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1380 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1380 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1380 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1380 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19196] The complementary binding of GAM1380 RNA, herein designated GAM RNA, to target binding sites on GAM1380 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1380 target RNA, herein designated GAM TARGET RNA, into GAM1380 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19197] It is appreciated that GAM1380 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1380 target genes. The

mRNA of each one of this plurality of GAM1380 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1380 RNA, herein designated GAM RNA, and which when bound by GAM1380 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1380 target proteins.

[19198] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1380 gene, herein designated GAM GENE, on one or more GAM1380 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19199] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1380 correlate with, and may be deduced from, the identity of the target genes which GAM1380 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19200] Nucleotide sequences of the GAM1380 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1380 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1380 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1380 are further described hereinbelow with reference to Table 1.

[19201] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1380 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19202] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1381 (GAM1381) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19203] GAM1381 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1381 was detected is described hereinabove with reference to Figs. 2-8.

[19204] GAM1381 gene, herein designated GAM GENE, and GAM1381 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19205] GAM1381 gene, herein designated GAM GENE, encodes a GAM1381 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1381 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1381 precursor RNA is designated SEQ ID:1358, and is provided hereinbelow with reference to the sequence listing part.

[19206] GAM1381 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19207] An enzyme complex designated DICER COMPLEX, dices the GAM1381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1381 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1381 RNA is designated SEQ ID:3963, and is provided hereinbelow with reference to the sequence listing part.

[19208] GAM1381 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1381 target RNA, herein designated GAM TARGET RNA. GAM1381 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19209] GAM1381 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1381 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1381 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1381 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1381 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19210] The complementary binding of GAM1381 RNA, herein designated GAM RNA, to target binding sites on GAM1381 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1381 target RNA, herein designated GAM TARGET RNA, into GAM1381 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19211] It is appreciated that GAM1381 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1381 target genes. The mRNA of each one of this plurality of GAM1381 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1381 RNA, herein designated GAM RNA, and which when bound by GAM1381 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1381 target proteins.

[19212] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1381 gene, herein designated GAM GENE, on one or more GAM1381 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19213] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1381 correlate with, and may be deduced from, the identity of the target

genes which GAM1381 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19214] Nucleotide sequences of the GAM1381 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1381 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1381 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1381 are further described hereinbelow with reference to Table 1.

[19215] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1381 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19216] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1382 (GAM1382) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19217] GAM1382 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1382 was detected is described hereinabove with reference to Figs. 2-8.

[19218] GAM1382 gene, herein designated GAM GENE, and GAM1382 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19219] GAM1382 gene, herein designated GAM GENE, encodes a GAM1382 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1382 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1382 precursor RNA is designated SEQ ID:1359, and is provided hereinbelow with reference to the sequence listing part.

[19220] GAM1382 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19221] An enzyme complex designated DICER COMPLEX, dices the GAM1382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1382 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1382 RNA is designated SEQ ID:3964, and is provided

hereinbelow with reference to the sequence listing part.

[19222] GAM1382 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1382 target RNA, herein designated GAM TARGET RNA. GAM1382 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19223] GAM1382 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1382 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1382 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1382 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1382 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19224] The complementary binding of GAM1382 RNA, herein designated GAM RNA, to target binding sites on GAM1382 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1382 target RNA, herein designated GAM TARGET RNA, into GAM1382 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19225] It is appreciated that GAM1382 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1382 target genes. The mRNA of each one of this plurality of GAM1382 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1382 RNA, herein designated GAM RNA, and which when bound by GAM1382 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1382 target proteins.

[19226] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1382 gene, herein designated GAM GENE, on one or more GAM1382 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19227] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1382 correlate with, and may be deduced from, the identity of the target genes which GAM1382 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19228] Nucleotide sequences of the GAM1382 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1382 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1382 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1382 are further described hereinbelow with reference to Table 1.

[19229] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1382 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19230] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1383 (GAM1383) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19231] GAM1383 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1383 was detected is described hereinabove with reference to Figs. 2-8.

[19232] GAM1383 gene, herein designated GAM GENE, and GAM1383 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19233] GAM1383 gene, herein designated GAM GENE, encodes a GAM1383 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1383 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1383 precursor RNA is designated SEQ ID:1360, and is provided hereinbelow with reference to the sequence listing part.

[19234] GAM1383 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19235] An enzyme complex designated DICER COMPLEX, dices the GAM1383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1383 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1383 RNA is designated SEQ ID:3965, and is provided hereinbelow with reference to the sequence listing part.

[19236] GAM1383 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1383 target RNA, herein designated GAM TARGET RNA. GAM1383 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19237] GAM1383 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1383 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1383 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1383 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1383 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19238] The complementary binding of GAM1383 RNA, herein designated GAM RNA, to target binding sites on GAM1383 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1383 target RNA, herein designated GAM TARGET RNA, into GAM1383 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19239] It is appreciated that GAM1383 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1383 target genes. The mRNA of each one of this plurality of GAM1383 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1383 RNA, herein designated GAM RNA, and which when bound by GAM1383 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1383 target proteins.

[19240] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1383 gene, herein designated GAM GENE, on one or more GAM1383 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19241] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1383 correlate with, and may be deduced from, the identity of the target genes which GAM1383 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19242] Nucleotide sequences of the GAM1383 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1383 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1383 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1383 are further described hereinbelow with reference to Table 1.

[19243] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1383 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19244] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1384 (GAM1384) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19245] GAM1384 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1384 was detected is described hereinabove with reference to Figs. 2-8.

[19246] GAM1384 gene, herein designated GAM GENE, and GAM1384 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19247] GAM1384 gene, herein designated GAM GENE, encodes a GAM1384 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1384 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1384 precursor RNA is designated SEQ ID:1361, and is provided hereinbelow with reference to the sequence listing part.

[19248] GAM1384 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19249] An enzyme complex designated DICER COMPLEX, dices the GAM1384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1384 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1384 RNA is designated SEQ ID:3966, and is provided hereinbelow with reference to the sequence listing part.

[19250] GAM1384 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1384 target RNA, herein designated GAM TARGET RNA. GAM1384 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19251] GAM1384 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1384 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1384 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1384 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1384 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19252] The complementary binding of GAM1384 RNA, herein designated GAM RNA, to target binding sites on GAM1384 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1384 target RNA, herein designated GAM TARGET RNA, into GAM1384 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19253] It is appreciated that GAM1384 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1384 target genes. The mRNA of each one of this plurality of GAM1384 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1384 RNA, herein designated GAM RNA, and which when bound by GAM1384 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1384 target proteins.

[19254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1384 gene, herein designated GAM GENE, on one or more GAM1384 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19255] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1384 correlate with, and may be deduced from, the identity of the target genes which GAM1384 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19256] Nucleotide sequences of the GAM1384 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1384 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1384 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1384 are further described hereinbelow with reference to Table 1.

[19257] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1384 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19258] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1385 (GAM1385) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19259] GAM1385 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1385 was detected is described hereinabove with reference to Figs. 2-8.

[19260] GAM1385 gene, herein designated GAM GENE, and GAM1385 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19261] GAM1385 gene, herein designated GAM GENE, encodes a GAM1385 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1385 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1385 precursor RNA is designated SEQ ID:1362, and is provided hereinbelow with reference to the sequence listing part.

[19262] GAM1385 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19263] An enzyme complex designated DICER COMPLEX, dices the GAM1385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1385 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1385 RNA is designated SEQ ID:3967, and is provided hereinbelow with reference to the sequence listing part.

[19264] GAM1385 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1385 target RNA, herein designated GAM TARGET RNA. GAM1385 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19265] GAM1385 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1385 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1385 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1385 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1385 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19266] The complementary binding of GAM1385 RNA, herein designated GAM RNA, to target binding sites on GAM1385 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1385 target RNA, herein designated GAM TARGET RNA, into GAM1385 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19267] It is appreciated that GAM1385 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1385 target genes. The mRNA of each one of this plurality of GAM1385 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1385 RNA, herein designated GAM RNA, and which when bound by GAM1385 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1385 target proteins.

[19268] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1385 gene, herein designated GAM GENE, on one or more GAM1385 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19269] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1385 correlate with, and may be deduced from, the identity of the target genes which GAM1385 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19270] Nucleotide sequences of the GAM1385 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1385 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1385 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1385 are further described hereinbelow with reference to Table 1.

[19271] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1385 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19272] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1386 (GAM1386) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19273] GAM1386 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1386 was detected is described hereinabove with reference to Figs. 2-8.

[19274] GAM1386 gene, herein designated GAM GENE, and GAM1386 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19275] GAM1386 gene, herein designated GAM GENE, encodes a GAM1386 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1386 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1386 precursor RNA is designated SEQ ID:1363, and is provided hereinbelow with reference to the sequence listing part.

[19276] GAM1386 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19277] An enzyme complex designated DICER COMPLEX, dices the GAM1386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1386 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1386 RNA is designated SEQ ID:3968, and is provided hereinbelow with reference to the sequence listing part.

[19278] GAM1386 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1386 target RNA, herein designated GAM TARGET RNA. GAM1386 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19279] GAM1386 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1386 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1386 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1386 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1386 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19280] The complementary binding of GAM1386 RNA, herein designated GAM RNA, to target binding sites on GAM1386 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1386 target RNA, herein designated GAM TARGET RNA, into GAM1386 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19281] It is appreciated that GAM1386 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1386 target genes. The

mRNA of each one of this plurality of GAM1386 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1386 RNA, herein designated GAM RNA, and which when bound by GAM1386 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1386 target proteins.

[19282] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1386 gene, herein designated GAM GENE, on one or more GAM1386 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19283] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1386 correlate with, and may be deduced from, the identity of the target genes which GAM1386 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19284] Nucleotide sequences of the GAM1386 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1386 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1386 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1386 are further described hereinbelow with reference to Table 1.

[19285] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1386 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19286] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1387 (GAM1387) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19287] GAM1387 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1387 was detected is described hereinabove with reference to Figs. 2-8.

[19288] GAM1387 gene, herein designated GAM GENE, and GAM1387 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19289] GAM1387 gene, herein designated GAM GENE, encodes a GAM1387 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1387 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1387 precursor RNA is designated SEQ ID:1364, and is provided hereinbelow with reference to the sequence listing part.

[19290] GAM1387 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19291] An enzyme complex designated DICER COMPLEX, dices the GAM1387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1387 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1387 RNA is designated SEQ ID:3969, and is provided hereinbelow with reference to the sequence listing part.

[19292] GAM1387 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1387 target RNA, herein designated GAM TARGET RNA. GAM1387 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19293] GAM1387 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1387 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1387 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1387 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1387 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19294] The complementary binding of GAM1387 RNA, herein designated GAM RNA, to target binding sites on GAM1387 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1387 target RNA, herein designated GAM TARGET RNA, into GAM1387 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19295] It is appreciated that GAM1387 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1387 target genes. The mRNA of each one of this plurality of GAM1387 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1387 RNA, herein designated GAM RNA, and which when bound by GAM1387 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1387 target proteins.

[19296] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1387 gene, herein designated GAM GENE, on one or more GAM1387 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19297] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1387 correlate with, and may be deduced from, the identity of the target

genes which GAM1387 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19298] Nucleotide sequences of the GAM1387 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1387 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1387 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1387 are further described hereinbelow with reference to Table 1.

[19299] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1387 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19300] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1388 (GAM1388) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19301] GAM1388 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1388 was detected is described hereinabove with reference to Figs. 2-8.

[19302] GAM1388 gene, herein designated GAM GENE, and GAM1388 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19303] GAM1388 gene, herein designated GAM GENE, encodes a GAM1388 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1388 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1388 precursor RNA is designated SEQ ID:1365, and is provided hereinbelow with reference to the sequence listing part.

[19304] GAM1388 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19305] An enzyme complex designated DICER COMPLEX, dices the GAM1388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1388 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1388 RNA is designated SEQ ID:3970, and is provided

hereinbelow with reference to the sequence listing part.

[19306] GAM1388 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1388 target RNA, herein designated GAM TARGET RNA. GAM1388 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19307] GAM1388 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1388 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1388 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1388 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1388 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19308] The complementary binding of GAM1388 RNA, herein designated GAM RNA, to target binding sites on GAM1388 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1388 target RNA, herein designated GAM TARGET RNA, into GAM1388 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19309] It is appreciated that GAM1388 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1388 target genes. The mRNA of each one of this plurality of GAM1388 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1388 RNA, herein designated GAM RNA, and which when bound by GAM1388 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1388 target proteins.

[19310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1388 gene, herein designated GAM GENE, on one or more GAM1388 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19311] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1388 correlate with, and may be deduced from, the identity of the target genes which GAM1388 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19312] Nucleotide sequences of the GAM1388 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1388 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1388 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1388 are further described hereinbelow with reference to Table 1.

[19313] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1388 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19314] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1389 (GAM1389) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19315] GAM1389 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1389 was detected is described hereinabove with reference to Figs. 2-8.

[19316] GAM1389 gene, herein designated GAM GENE, and GAM1389 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19317] GAM1389 gene, herein designated GAM GENE, encodes a GAM1389 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1389 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1389 precursor RNA is designated SEQ ID:1366, and is provided hereinbelow with reference to the sequence listing part.

[19318] GAM1389 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19319] An enzyme complex designated DICER COMPLEX, dices the GAM1389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1389 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1389 RNA is designated SEQ ID:3971, and is provided hereinbelow with reference to the sequence listing part.

[19320] GAM1389 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1389 target RNA, herein designated GAM TARGET RNA. GAM1389 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19321] GAM1389 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1389 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1389 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1389 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1389 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19322] The complementary binding of GAM1389 RNA, herein designated GAM RNA, to target binding sites on GAM1389 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1389 target RNA, herein designated GAM TARGET RNA, into GAM1389 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19323] It is appreciated that GAM1389 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1389 target genes. The mRNA of each one of this plurality of GAM1389 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1389 RNA, herein designated GAM RNA, and which when bound by GAM1389 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1389 target proteins.

[19324] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1389 gene, herein designated GAM GENE, on one or more GAM1389 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19325] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1389 correlate with, and may be deduced from, the identity of the target genes which GAM1389 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19326] Nucleotide sequences of the GAM1389 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1389 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1389 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1389 are further described hereinbelow with reference to Table 1.

[19327] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1389 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19328] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1390 (GAM1390) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19329] GAM1390 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1390 was detected is described hereinabove with reference to Figs. 2-8.

[19330] GAM1390 gene, herein designated GAM GENE, and GAM1390 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19331] GAM1390 gene, herein designated GAM GENE, encodes a GAM1390 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1390 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1390 precursor RNA is designated SEQ ID:1367, and is provided hereinbelow with reference to the sequence listing part.

[19332] GAM1390 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19333] An enzyme complex designated DICER COMPLEX, dices the GAM1390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1390 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1390 RNA is designated SEQ ID:3972, and is provided hereinbelow with reference to the sequence listing part.

[19334] GAM1390 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1390 target RNA, herein designated GAM TARGET RNA. GAM1390 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19335] GAM1390 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1390 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1390 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1390 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1390 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19336] The complementary binding of GAM1390 RNA, herein designated GAM RNA, to target binding sites on GAM1390 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1390 target RNA, herein designated GAM TARGET RNA, into GAM1390 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19337] It is appreciated that GAM1390 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1390 target genes. The mRNA of each one of this plurality of GAM1390 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1390 RNA, herein designated GAM RNA, and which when bound by GAM1390 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1390 target proteins.

[19338] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1390 gene, herein designated GAM GENE, on one or more GAM1390 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19339] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1390 correlate with, and may be deduced from, the identity of the target genes which GAM1390 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19340] Nucleotide sequences of the GAM1390 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1390 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1390 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1390 are further described hereinbelow with reference to Table 1.

[19341] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1390 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19342] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1391 (GAM1391) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19343] GAM1391 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1391 was detected is described hereinabove with reference to Figs. 2-8.

[19344] GAM1391 gene, herein designated GAM GENE, and GAM1391 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19345] GAM1391 gene, herein designated GAM GENE, encodes a GAM1391 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1391 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1391 precursor RNA is designated SEQ ID:1368, and is provided hereinbelow with reference to the sequence listing part.

[19346] GAM1391 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19347] An enzyme complex designated DICER COMPLEX, dices the GAM1391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1391 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1391 RNA is designated SEQ ID:3973, and is provided hereinbelow with reference to the sequence listing part.

[19348] GAM1391 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1391 target RNA, herein designated GAM TARGET RNA. GAM1391 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19349] GAM1391 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1391 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1391 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1391 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1391 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19350] The complementary binding of GAM1391 RNA, herein designated GAM RNA, to target binding sites on GAM1391 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1391 target RNA, herein designated GAM TARGET RNA, into GAM1391 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19351] It is appreciated that GAM1391 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1391 target genes. The mRNA of each one of this plurality of GAM1391 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1391 RNA, herein designated GAM RNA, and which when bound by GAM1391 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1391 target proteins.

[19352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1391 gene, herein designated GAM GENE, on one or more GAM1391 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19353] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1391 correlate with, and may be deduced from, the identity of the target genes which GAM1391 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19354] Nucleotide sequences of the GAM1391 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1391 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1391 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1391 are further described hereinbelow with reference to Table 1.

[19355] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1391 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19356] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1392 (GAM1392) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19357] GAM1392 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1392 was detected is described hereinabove with reference to Figs. 2-8.

[19358] GAM1392 gene, herein designated GAM GENE, and GAM1392 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19359] GAM1392 gene, herein designated GAM GENE, encodes a GAM1392 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1392 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1392 precursor RNA is designated SEQ ID:1369, and is provided hereinbelow with reference to the sequence listing part.

[19360] GAM1392 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19361] An enzyme complex designated DICER COMPLEX, dices the GAM1392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1392 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1392 RNA is designated SEQ ID:3974, and is provided hereinbelow with reference to the sequence listing part.

[19362] GAM1392 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1392 target RNA, herein designated GAM TARGET RNA. GAM1392 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19363] GAM1392 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1392 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1392 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1392 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1392 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19364] The complementary binding of GAM1392 RNA, herein designated GAM RNA, to target binding sites on GAM1392 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1392 target RNA, herein designated GAM TARGET RNA, into GAM1392 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19365] It is appreciated that GAM1392 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1392 target genes. The

mRNA of each one of this plurality of GAM1392 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1392 RNA, herein designated GAM RNA, and which when bound by GAM1392 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1392 target proteins.

[19366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1392 gene, herein designated GAM GENE, on one or more GAM1392 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19367] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1392 correlate with, and may be deduced from, the identity of the target genes which GAM1392 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19368] Nucleotide sequences of the GAM1392 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1392 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1392 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1392 are further described hereinbelow with reference to Table 1.

[19369] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1392 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19370] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1393 (GAM1393) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19371] GAM1393 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1393 was detected is described hereinabove with reference to Figs. 2-8.

[19372] GAM1393 gene, herein designated GAM GENE, and GAM1393 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19373] GAM1393 gene, herein designated GAM GENE, encodes a GAM1393 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1393 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1393 precursor RNA is designated SEQ ID:1370, and is provided hereinbelow with reference to the sequence listing part.

[19374] GAM1393 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19375] An enzyme complex designated DICER COMPLEX, dices the GAM1393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1393 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1393 RNA is designated SEQ ID:3975, and is provided hereinbelow with reference to the sequence listing part.

[19376] GAM1393 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1393 target RNA, herein designated GAM TARGET RNA. GAM1393 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19377] GAM1393 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1393 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1393 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1393 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1393 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19378] The complementary binding of GAM1393 RNA, herein designated GAM RNA, to target binding sites on GAM1393 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1393 target RNA, herein designated GAM TARGET RNA, into GAM1393 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19379] It is appreciated that GAM1393 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1393 target genes. The mRNA of each one of this plurality of GAM1393 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1393 RNA, herein designated GAM RNA, and which when bound by GAM1393 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1393 target proteins.

[19380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1393 gene, herein designated GAM GENE, on one or more GAM1393 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19381] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1393 correlate with, and may be deduced from, the identity of the target

genes which GAM1393 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19382] Nucleotide sequences of the GAM1393 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1393 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1393 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1393 are further described hereinbelow with reference to Table 1.

[19383] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1393 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19384] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1394 (GAM1394) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19385] GAM1394 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1394 was detected is described hereinabove with reference to Figs. 2-8.

[19386] GAM1394 gene, herein designated GAM GENE, and GAM1394 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19387] GAM1394 gene, herein designated GAM GENE, encodes a GAM1394 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1394 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1394 precursor RNA is designated SEQ ID:1371, and is provided hereinbelow with reference to the sequence listing part.

[19388] GAM1394 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19389] An enzyme complex designated DICER COMPLEX, dices the GAM1394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1394 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM1394 RNA is designated SEQ ID:3976, and is provided hereinbelow with reference to the sequence listing part.

[19390] GAM1394 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1394 target RNA, herein designated GAM TARGET RNA. GAM1394 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19391] GAM1394 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1394 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1394 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1394 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1394 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19392] The complementary binding of GAM1394 RNA, herein designated GAM RNA, to target binding sites on GAM1394 target RNA, herein designated

GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1394 target RNA, herein designated GAM TARGET RNA, into GAM1394 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19393] It is appreciated that GAM1394 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1394 target genes. The mRNA of each one of this plurality of GAM1394 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1394 RNA, herein designated GAM RNA, and which when bound by GAM1394 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1394 target proteins.

[19394] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1394 gene, herein designated GAM GENE, on one or more GAM1394 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19395] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1394 correlate with, and may be deduced from, the identity of the target genes which GAM1394 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19396] Nucleotide sequences of the GAM1394 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1394 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1394 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1394 are further described hereinbelow with reference to Table 1.

[19397] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1394 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19398] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1395 (GAM1395) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19399] GAM1395 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1395 was detected is described hereinabove with reference to Figs. 2-8.

[19400] GAM1395 gene, herein designated GAM GENE, and GAM1395 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19401] GAM1395 gene, herein designated GAM GENE, encodes a GAM1395 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1395 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1395 precursor RNA is designated SEQ ID:1372, and is provided hereinbelow with reference to the sequence listing part.

[19402] GAM1395 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19403] An enzyme complex designated DICER COMPLEX, dices the GAM1395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1395 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1395 RNA is designated SEQ ID:3977, and is provided hereinbelow with reference to the sequence listing part.

[19404] GAM1395 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1395 target RNA, herein designated GAM TARGET RNA. GAM1395 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19405] GAM1395 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1395 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1395 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1395 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1395 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[19406] The complementary binding of GAM1395 RNA, herein designated GAM RNA, to target binding sites on GAM1395 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1395 target RNA, herein designated GAM TARGET RNA, into GAM1395 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19407] It is appreciated that GAM1395 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1395 target genes. The mRNA of each one of this plurality of GAM1395 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1395 RNA, herein designated GAM RNA, and which when bound by GAM1395 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1395 target proteins.

[19408] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1395 gene, herein designated GAM GENE, on one or more GAM1395 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19409] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1395 correlate with, and may be deduced from, the identity of the target genes which GAM1395 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19410] Nucleotide sequences of the GAM1395 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1395 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1395 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1395 are further described hereinbelow with reference to Table 1.

[19411] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1395 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19412] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1396 (GAM1396) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19413] GAM1396 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1396 was detected is described hereinabove with reference to Figs. 2-8.

[19414] GAM1396 gene, herein designated GAM GENE, and GAM1396 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19415] GAM1396 gene, herein designated GAM GENE, encodes a GAM1396 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1396 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1396 precursor RNA is designated SEQ ID:1373, and is provided hereinbelow with reference to the sequence listing part.

[19416] GAM1396 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19417] An enzyme complex designated DICER COMPLEX, dices the GAM1396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1396 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1396 RNA is designated SEQ ID:3978, and is provided hereinbelow with reference to the sequence listing part.

[19418] GAM1396 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1396 target RNA, herein designated GAM TARGET RNA. GAM1396 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19419] GAM1396 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1396 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1396 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1396 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1396 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19420] The complementary binding of GAM1396 RNA, herein designated GAM RNA, to target binding sites on GAM1396 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1396 target RNA, herein designated GAM TARGET RNA, into GAM1396 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19421] It is appreciated that GAM1396 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1396 target genes. The mRNA of each one of this plurality of GAM1396 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1396 RNA, herein designated GAM RNA, and which when bound by GAM1396 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1396 target proteins.

[19422] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1396 gene, herein designated GAM GENE, on one or more GAM1396 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19423] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1396 correlate with, and may be deduced from, the identity of the target genes which GAM1396 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19424] Nucleotide sequences of the GAM1396 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1396 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1396 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1396 are further described hereinbelow with reference to Table 1.

[19425] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1396 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19426] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1397 (GAM1397) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19427] GAM1397 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1397 was detected is described hereinabove with reference to Figs. 2-8.

[19428] GAM1397 gene, herein designated GAM GENE, and GAM1397 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19429] GAM1397 gene, herein designated GAM GENE, encodes a GAM1397 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1397 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1397 precursor RNA is designated SEQ ID:1374, and is provided hereinbelow with reference to the sequence listing part.

[19430] GAM1397 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19431] An enzyme complex designated DICER COMPLEX, dices the GAM1397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1397 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1397 RNA is designated SEQ ID:3979, and is provided hereinbelow with reference to the sequence listing part.

[19432] GAM1397 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1397 target RNA, herein designated GAM TARGET RNA. GAM1397 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19433] GAM1397 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1397 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1397 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1397 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1397 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19434] The complementary binding of GAM1397 RNA, herein designated GAM RNA, to target binding sites on GAM1397 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1397 target RNA, herein designated GAM TARGET RNA, into GAM1397 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19435] It is appreciated that GAM1397 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1397 target genes. The mRNA of each one of this plurality of GAM1397 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1397 RNA, herein designated GAM RNA, and which when bound by GAM1397 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1397 target proteins.

[19436] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1397 gene, herein designated GAM GENE, on one or more GAM1397 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19437] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1397 correlate with, and may be deduced from, the identity of the target genes which GAM1397 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19438] Nucleotide sequences of the GAM1397 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1397 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1397 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1397 are further described hereinbelow with reference to Table 1.

[19439] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1397 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19440] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1398 (GAM1398) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19441] GAM1398 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1398 was detected is described hereinabove with reference to Figs. 2-8.

[19442] GAM1398 gene, herein designated GAM GENE, and GAM1398 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19443] GAM1398 gene, herein designated GAM GENE, encodes a GAM1398 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1398 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1398 precursor RNA is designated SEQ ID:1375, and is provided hereinbelow with reference to the sequence listing part.

[19444] GAM1398 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19445] An enzyme complex designated DICER COMPLEX, dices the GAM1398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1398 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1398 RNA is designated SEQ ID:3980, and is provided hereinbelow with reference to the sequence listing part.

[19446] GAM1398 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1398 target RNA, herein designated GAM TARGET RNA. GAM1398 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19447] GAM1398 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1398 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1398 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1398 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1398 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19448] The complementary binding of GAM1398 RNA, herein designated GAM RNA, to target binding sites on GAM1398 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1398 target RNA, herein designated GAM TARGET RNA, into GAM1398 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19449] It is appreciated that GAM1398 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1398 target genes. The mRNA of each one of this plurality of GAM1398 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1398 RNA, herein designated GAM RNA, and which when bound by GAM1398 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1398 target proteins.

[19450] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1398 gene, herein designated GAM GENE, on one or more GAM1398 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19451] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1398 correlate with, and may be deduced from, the identity of the target genes which GAM1398 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19452] Nucleotide sequences of the GAM1398 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1398 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1398 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1398 are further described hereinbelow with reference to Table 1.

[19453] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1398 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19454] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1399 (GAM1399) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19455] GAM1399 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1399 was detected is described hereinabove with reference to Figs. 2-8.

[19456] GAM1399 gene, herein designated GAM GENE, and GAM1399 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19457] GAM1399 gene, herein designated GAM GENE, encodes a GAM1399 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1399 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1399 precursor RNA is designated SEQ ID:1376, and is provided hereinbelow with reference to the sequence listing part.

[19458] GAM1399 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19459] An enzyme complex designated DICER COMPLEX, dices the GAM1399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1399 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1399 RNA is designated SEQ ID:3981, and is provided hereinbelow with reference to the sequence listing part.

[19460] GAM1399 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1399 target RNA, herein designated GAM TARGET RNA. GAM1399 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19461] GAM1399 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1399 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1399 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1399 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1399 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19462] The complementary binding of GAM1399 RNA, herein designated GAM RNA, to target binding sites on GAM1399 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1399 target RNA, herein designated GAM TARGET RNA, into GAM1399 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19463] It is appreciated that GAM1399 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1399 target genes. The

mRNA of each one of this plurality of GAM1399 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1399 RNA, herein designated GAM RNA, and which when bound by GAM1399 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1399 target proteins.

[19464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1399 gene, herein designated GAM GENE, on one or more GAM1399 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19465] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1399 correlate with, and may be deduced from, the identity of the target genes which GAM1399 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19466] Nucleotide sequences of the GAM1399 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1399 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1399 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1399 are further described hereinbelow with reference to Table 1.

[19467] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1399 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19468] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1400 (GAM1400) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19469] GAM1400 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1400 was detected is described hereinabove with reference to Figs. 2-8.

[19470] GAM1400 gene, herein designated GAM GENE, and GAM1400 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19471] GAM1400 gene, herein designated GAM GENE, encodes a GAM1400 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1400 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1400 precursor RNA is designated SEQ ID:1377, and is provided hereinbelow with reference to the sequence listing part.

[19472] GAM1400 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19473] An enzyme complex designated DICER COMPLEX, dices the GAM1400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1400 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1400 RNA is designated SEQ ID:3982, and is provided hereinbelow with reference to the sequence listing part.

[19474] GAM1400 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1400 target RNA, herein designated GAM TARGET RNA. GAM1400 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19475] GAM1400 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1400 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1400 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1400 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1400 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19476] The complementary binding of GAM1400 RNA, herein designated GAM RNA, to target binding sites on GAM1400 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1400 target RNA, herein designated GAM TARGET RNA, into GAM1400 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19477] It is appreciated that GAM1400 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1400 target genes. The mRNA of each one of this plurality of GAM1400 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1400 RNA, herein designated GAM RNA, and which when bound by GAM1400 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1400 target proteins.

[19478] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1400 gene, herein designated GAM GENE, on one or more GAM1400 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19479] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1400 correlate with, and may be deduced from, the identity of the target

genes which GAM1400 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19480] Nucleotide sequences of the GAM1400 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1400 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1400 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1400 are further described hereinbelow with reference to Table 1.

[19481] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1400 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19482] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1401 (GAM1401) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19483] GAM1401 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1401 was detected is described hereinabove with reference to Figs. 2-8.

[19484] GAM1401 gene, herein designated GAM GENE, and GAM1401 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19485] GAM1401 gene, herein designated GAM GENE, encodes a GAM1401 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1401 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1401 precursor RNA is designated SEQ ID:1378, and is provided hereinbelow with reference to the sequence listing part.

[19486] GAM1401 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19487] An enzyme complex designated DICER COMPLEX, dices the GAM1401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1401 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1401 RNA is designated SEQ ID:3983, and is provided

hereinbelow with reference to the sequence listing part.

[19488] GAM1401 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1401 target RNA, herein designated GAM TARGET RNA. GAM1401 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19489] GAM1401 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1401 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1401 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1401 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1401 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19490] The complementary binding of GAM1401 RNA, herein designated GAM RNA, to target binding sites on GAM1401 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1401 target RNA, herein designated GAM TARGET RNA, into GAM1401 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19491] It is appreciated that GAM1401 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1401 target genes. The mRNA of each one of this plurality of GAM1401 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1401 RNA, herein designated GAM RNA, and which when bound by GAM1401 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1401 target proteins.

[19492] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1401 gene, herein designated GAM GENE, on one or more GAM1401 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19493] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1401 correlate with, and may be deduced from, the identity of the target genes which GAM1401 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19494] Nucleotide sequences of the GAM1401 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1401 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1401 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1401 are further described hereinbelow with reference to Table 1.

[19495] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1401 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19496] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1402 (GAM1402) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19497] GAM1402 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1402 was detected is described hereinabove with reference to Figs. 2-8.

[19498] GAM1402 gene, herein designated GAM GENE, and GAM1402 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19499] GAM1402 gene, herein designated GAM GENE, encodes a GAM1402 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1402 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1402 precursor RNA is designated SEQ ID:1379, and is provided hereinbelow with reference to the sequence listing part.

[19500] GAM1402 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19501] An enzyme complex designated DICER COMPLEX, dices the GAM1402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1402 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1402 RNA is designated SEQ ID:3984, and is provided hereinbelow with reference to the sequence listing part.

[19502] GAM1402 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1402 target RNA, herein designated GAM TARGET RNA. GAM1402 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19503] GAM1402 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1402 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1402 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1402 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1402 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19504] The complementary binding of GAM1402 RNA, herein designated GAM RNA, to target binding sites on GAM1402 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1402 target RNA, herein designated GAM TARGET RNA, into GAM1402 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19505] It is appreciated that GAM1402 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1402 target genes. The mRNA of each one of this plurality of GAM1402 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1402 RNA, herein designated GAM RNA, and which when bound by GAM1402 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1402 target proteins.

[19506] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1402 gene, herein designated GAM GENE, on one or more GAM1402 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19507] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1402 correlate with, and may be deduced from, the identity of the target genes which GAM1402 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19508] Nucleotide sequences of the GAM1402 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1402 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1402 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1402 are further described hereinbelow with reference to Table 1.

[19509] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1402 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19510] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1403 (GAM1403) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19511] GAM1403 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1403 was detected is described hereinabove with reference to Figs. 2-8.

[19512] GAM1403 gene, herein designated GAM GENE, and GAM1403 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19513] GAM1403 gene, herein designated GAM GENE, encodes a GAM1403 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1403 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1403 precursor RNA is designated SEQ ID:1380, and is provided hereinbelow with reference to the sequence listing part.

[19514] GAM1403 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19515] An enzyme complex designated DICER COMPLEX, dices the GAM1403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1403 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1403 RNA is designated SEQ ID:3985, and is provided hereinbelow with reference to the sequence listing part.

[19516] GAM1403 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1403 target RNA, herein designated GAM TARGET RNA. GAM1403 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19517] GAM1403 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1403 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1403 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1403 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1403 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19518] The complementary binding of GAM1403 RNA, herein designated GAM RNA, to target binding sites on GAM1403 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1403 target RNA, herein designated GAM TARGET RNA, into GAM1403 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19519] It is appreciated that GAM1403 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1403 target genes. The mRNA of each one of this plurality of GAM1403 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1403 RNA, herein designated GAM RNA, and which when bound by GAM1403 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1403 target proteins.

[19520] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1403 gene, herein designated GAM GENE, on one or more GAM1403 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19521] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1403 correlate with, and may be deduced from, the identity of the target genes which GAM1403 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19522] Nucleotide sequences of the GAM1403 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1403 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1403 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1403 are further described hereinbelow with reference to Table 1.

[19523] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1403 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19524] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1404 (GAM1404) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19525] GAM1404 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1404 was detected is described hereinabove with reference to Figs. 2-8.

[19526] GAM1404 gene, herein designated GAM GENE, and GAM1404 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19527] GAM1404 gene, herein designated GAM GENE, encodes a GAM1404 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1404 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1404 precursor RNA is designated SEQ ID:1381, and is provided hereinbelow with reference to the sequence listing part.

[19528] GAM1404 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19529] An enzyme complex designated DICER COMPLEX, dices the GAM1404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1404 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1404 RNA is designated SEQ ID:3986, and is provided hereinbelow with reference to the sequence listing part.

[19530] GAM1404 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1404 target RNA, herein designated GAM TARGET RNA. GAM1404 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19531] GAM1404 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1404 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1404 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1404 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1404 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19532] The complementary binding of GAM1404 RNA, herein designated GAM RNA, to target binding sites on GAM1404 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1404 target RNA, herein designated GAM TARGET RNA, into GAM1404 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19533] It is appreciated that GAM1404 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1404 target genes. The mRNA of each one of this plurality of GAM1404 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1404 RNA, herein designated GAM RNA, and which when bound by GAM1404 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1404 target proteins.

[19534] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1404 gene, herein designated GAM GENE, on one or more GAM1404 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19535] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1404 correlate with, and may be deduced from, the identity of the target genes which GAM1404 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19536] Nucleotide sequences of the GAM1404 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1404 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1404 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1404 are further described hereinbelow with reference to Table 1.

[19537] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1404 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19538] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1405 (GAM1405) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19539] GAM1405 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1405 was detected is described hereinabove with reference to Figs. 2-8.

[19540] GAM1405 gene, herein designated GAM GENE, and GAM1405 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19541] GAM1405 gene, herein designated GAM GENE, encodes a GAM1405 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1405 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1405 precursor RNA is designated SEQ ID:1382, and is provided hereinbelow with reference to the sequence listing part.

[19542] GAM1405 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19543] An enzyme complex designated DICER COMPLEX, dices the GAM1405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1405 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1405 RNA is designated SEQ ID:3987, and is provided hereinbelow with reference to the sequence listing part.

[19544] GAM1405 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1405 target RNA, herein designated GAM TARGET RNA. GAM1405 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19545] GAM1405 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1405 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1405 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1405 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1405 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19546] The complementary binding of GAM1405 RNA, herein designated GAM RNA, to target binding sites on GAM1405 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1405 target RNA, herein designated GAM TARGET RNA, into GAM1405 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19547] It is appreciated that GAM1405 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1405 target genes. The

mRNA of each one of this plurality of GAM1405 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1405 RNA, herein designated GAM RNA, and which when bound by GAM1405 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1405 target proteins.

[19548] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1405 gene, herein designated GAM GENE, on one or more GAM1405 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19549] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1405 correlate with, and may be deduced from, the identity of the target genes which GAM1405 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19550] Nucleotide sequences of the GAM1405 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1405 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1405 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1405 are further described hereinbelow with reference to Table 1.

[19551] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1405 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19552] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1406 (GAM1406) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19553] GAM1406 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1406 was detected is described hereinabove with reference to Figs. 2-8.

[19554] GAM1406 gene, herein designated GAM GENE, and GAM1406 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19555] GAM1406 gene, herein designated GAM GENE, encodes a GAM1406 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1406 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1406 precursor RNA is designated SEQ ID:1383, and is provided hereinbelow with reference to the sequence listing part.

[19556] GAM1406 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19557] An enzyme complex designated DICER COMPLEX, dices the GAM1406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1406 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1406 RNA is designated SEQ ID:3988, and is provided hereinbelow with reference to the sequence listing part.

[19558] GAM1406 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1406 target RNA, herein designated GAM TARGET RNA. GAM1406 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19559] GAM1406 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1406 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1406 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1406 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1406 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19560] The complementary binding of GAM1406 RNA, herein designated GAM RNA, to target binding sites on GAM1406 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1406 target RNA, herein designated GAM TARGET RNA, into GAM1406 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19561] It is appreciated that GAM1406 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1406 target genes. The mRNA of each one of this plurality of GAM1406 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1406 RNA, herein designated GAM RNA, and which when bound by GAM1406 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1406 target proteins.

[19562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1406 gene, herein designated GAM GENE, on one or more GAM1406 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19563] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1406 correlate with, and may be deduced from, the identity of the target

genes which GAM1406 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19564] Nucleotide sequences of the GAM1406 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1406 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1406 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1406 are further described hereinbelow with reference to Table 1.

[19565] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1406 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19566] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1407 (GAM1407) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19567] GAM1407 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1407 was detected is described hereinabove with reference to Figs. 2-8.

[19568] GAM1407 gene, herein designated GAM GENE, and GAM1407 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19569] GAM1407 gene, herein designated GAM GENE, encodes a GAM1407 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1407 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1407 precursor RNA is designated SEQ ID:1384, and is provided hereinbelow with reference to the sequence listing part.

[19570] GAM1407 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19571] An enzyme complex designated DICER COMPLEX, dices the GAM1407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1407 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1407 RNA is designated SEQ ID:3989, and is provided

hereinbelow with reference to the sequence listing part.

[19572] GAM1407 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1407 target RNA, herein designated GAM TARGET RNA. GAM1407 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19573] GAM1407 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1407 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1407 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1407 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1407 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19574] The complementary binding of GAM1407 RNA, herein designated GAM RNA, to target binding sites on GAM1407 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1407 target RNA, herein designated GAM TARGET RNA, into GAM1407 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19575] It is appreciated that GAM1407 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1407 target genes. The mRNA of each one of this plurality of GAM1407 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1407 RNA, herein designated GAM RNA, and which when bound by GAM1407 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1407 target proteins.

[19576] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1407 gene, herein designated GAM GENE, on one or more GAM1407 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19577] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1407 correlate with, and may be deduced from, the identity of the target genes which GAM1407 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19578] Nucleotide sequences of the GAM1407 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1407 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1407 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1407 are further described hereinbelow with reference to Table 1.

[19579] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1407 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19580] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1408 (GAM1408) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19581] GAM1408 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1408 was detected is described hereinabove with reference to Figs. 2-8.

[19582] GAM1408 gene, herein designated GAM GENE, and GAM1408 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19583] GAM1408 gene, herein designated GAM GENE, encodes a GAM1408 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1408 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1408 precursor RNA is designated SEQ ID:1385, and is provided hereinbelow with reference to the sequence listing part.

[19584] GAM1408 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19585] An enzyme complex designated DICER COMPLEX, dices the GAM1408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1408 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1408 RNA is designated SEQ ID:3990, and is provided hereinbelow with reference to the sequence listing part.

[19586] GAM1408 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1408 target RNA, herein designated GAM TARGET RNA. GAM1408 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19587] GAM1408 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1408 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1408 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1408 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1408 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19588] The complementary binding of GAM1408 RNA, herein designated GAM RNA, to target binding sites on GAM1408 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1408 target RNA, herein designated GAM TARGET RNA, into GAM1408 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19589] It is appreciated that GAM1408 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1408 target genes. The mRNA of each one of this plurality of GAM1408 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1408 RNA, herein designated GAM RNA, and which when bound by GAM1408 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1408 target proteins.

[19590] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1408 gene, herein designated GAM GENE, on one or more GAM1408 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19591] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1408 correlate with, and may be deduced from, the identity of the target genes which GAM1408 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19592] Nucleotide sequences of the GAM1408 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1408 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1408 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1408 are further described hereinbelow with reference to Table 1.

[19593] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1408 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19594] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1409 (GAM1409) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19595] GAM1409 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1409 was detected is described hereinabove with reference to Figs. 2-8.

[19596] GAM1409 gene, herein designated GAM GENE, and GAM1409 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19597] GAM1409 gene, herein designated GAM GENE, encodes a GAM1409 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1409 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1409 precursor RNA is designated SEQ ID:1386, and is provided hereinbelow with reference to the sequence listing part.

[19598] GAM1409 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19599] An enzyme complex designated DICER COMPLEX, dices the GAM1409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1409 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1409 RNA is designated SEQ ID:3991, and is provided hereinbelow with reference to the sequence listing part.

[19600] GAM1409 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1409 target RNA, herein designated GAM TARGET RNA. GAM1409 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19601] GAM1409 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1409 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1409 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1409 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1409 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19602] The complementary binding of GAM1409 RNA, herein designated GAM RNA, to target binding sites on GAM1409 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1409 target RNA, herein designated GAM TARGET RNA, into GAM1409 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19603] It is appreciated that GAM1409 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1409 target genes. The mRNA of each one of this plurality of GAM1409 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1409 RNA, herein designated GAM RNA, and which when bound by GAM1409 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1409 target proteins.

[19604] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1409 gene, herein designated GAM GENE, on one or more GAM1409 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19605] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1409 correlate with, and may be deduced from, the identity of the target genes which GAM1409 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19606] Nucleotide sequences of the GAM1409 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1409 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1409 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1409 are further described hereinbelow with reference to Table 1.

[19607] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1409 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19608] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1410 (GAM1410) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19609] GAM1410 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1410 was detected is described hereinabove with reference to Figs. 2-8.

[19610] GAM1410 gene, herein designated GAM GENE, and GAM1410 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19611] GAM1410 gene, herein designated GAM GENE, encodes a GAM1410 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1410 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1410 precursor RNA is designated SEQ ID:1387, and is provided hereinbelow with reference to the sequence listing part.

[19612] GAM1410 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19613] An enzyme complex designated DICER COMPLEX, dices the GAM1410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1410 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1410 RNA is designated SEQ ID:3992, and is provided hereinbelow with reference to the sequence listing part.

[19614] GAM1410 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1410 target RNA, herein designated GAM TARGET RNA. GAM1410 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19615] GAM1410 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1410 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1410 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1410 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1410 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19616] The complementary binding of GAM1410 RNA, herein designated GAM RNA, to target binding sites on GAM1410 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1410 target RNA, herein designated GAM TARGET RNA, into GAM1410 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19617] It is appreciated that GAM1410 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1410 target genes. The mRNA of each one of this plurality of GAM1410 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1410 RNA, herein designated GAM RNA, and which when bound by GAM1410 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1410 target proteins.

[19618] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1410 gene, herein designated GAM GENE, on one or more GAM1410 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19619] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1410 correlate with, and may be deduced from, the identity of the target genes which GAM1410 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19620] Nucleotide sequences of the GAM1410 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1410 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1410 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1410 are further described hereinbelow with reference to Table 1.

[19621] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1410 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19622] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1411 (GAM1411) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19623] GAM1411 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1411 was detected is described hereinabove with reference to Figs. 2-8.

[19624] GAM1411 gene, herein designated GAM GENE, and GAM1411 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19625] GAM1411 gene, herein designated GAM GENE, encodes a GAM1411 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1411 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1411 precursor RNA is designated SEQ ID:1388, and is provided hereinbelow with reference to the sequence listing part.

[19626] GAM1411 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19627] An enzyme complex designated DICER COMPLEX, dices the GAM1411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1411 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1411 RNA is designated SEQ ID:3993, and is provided hereinbelow with reference to the sequence listing part.

[19628] GAM1411 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1411 target RNA, herein designated GAM TARGET RNA. GAM1411 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19629] GAM1411 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1411 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1411 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1411 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1411 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19630] The complementary binding of GAM1411 RNA, herein designated GAM RNA, to target binding sites on GAM1411 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1411 target RNA, herein designated GAM TARGET RNA, into GAM1411 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19631] It is appreciated that GAM1411 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1411 target genes. The

mRNA of each one of this plurality of GAM1411 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1411 RNA, herein designated GAM RNA, and which when bound by GAM1411 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1411 target proteins.

[19632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1411 gene, herein designated GAM GENE, on one or more GAM1411 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19633] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1411 correlate with, and may be deduced from, the identity of the target genes which GAM1411 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19634] Nucleotide sequences of the GAM1411 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1411 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1411 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1411 are further described hereinbelow with reference to Table 1.

[19635] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1411 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19636] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1412 (GAM1412) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19637] GAM1412 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1412 was detected is described hereinabove with reference to Figs. 2-8.

[19638] GAM1412 gene, herein designated GAM GENE, and GAM1412 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19639] GAM1412 gene, herein designated GAM GENE, encodes a GAM1412 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1412 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1412 precursor RNA is designated SEQ ID:1389, and is provided hereinbelow with reference to the sequence listing part.

[19640] GAM1412 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19641] An enzyme complex designated DICER COMPLEX, dices the GAM1412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1412 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1412 RNA is designated SEQ ID:3994, and is provided hereinbelow with reference to the sequence listing part.

[19642] GAM1412 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1412 target RNA, herein designated GAM TARGET RNA. GAM1412 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19643] GAM1412 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1412 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1412 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1412 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1412 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19644] The complementary binding of GAM1412 RNA, herein designated GAM RNA, to target binding sites on GAM1412 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1412 target RNA, herein designated GAM TARGET RNA, into GAM1412 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19645] It is appreciated that GAM1412 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1412 target genes. The mRNA of each one of this plurality of GAM1412 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1412 RNA, herein designated GAM RNA, and which when bound by GAM1412 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1412 target proteins.

[19646] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1412 gene, herein designated GAM GENE, on one or more GAM1412 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19647] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1412 correlate with, and may be deduced from, the identity of the target

genes which GAM1412 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19648] Nucleotide sequences of the GAM1412 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1412 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1412 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1412 are further described hereinbelow with reference to Table 1.

[19649] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1412 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19650] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1413 (GAM1413) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19651] GAM1413 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1413 was detected is described hereinabove with reference to Figs. 2-8.

[19652] GAM1413 gene, herein designated GAM GENE, and GAM1413 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19653] GAM1413 gene, herein designated GAM GENE, encodes a GAM1413 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1413 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1413 precursor RNA is designated SEQ ID:1390, and is provided hereinbelow with reference to the sequence listing part.

[19654] GAM1413 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19655] An enzyme complex designated DICER COMPLEX, dices the GAM1413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1413 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1413 RNA is designated SEQ ID:3995, and is provided

hereinbelow with reference to the sequence listing part.

[19656] GAM1413 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1413 target RNA, herein designated GAM TARGET RNA. GAM1413 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19657] GAM1413 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1413 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1413 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1413 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1413 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19658] The complementary binding of GAM1413 RNA, herein designated GAM RNA, to target binding sites on GAM1413 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1413 target RNA, herein designated GAM TARGET RNA, into GAM1413 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19659] It is appreciated that GAM1413 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1413 target genes. The mRNA of each one of this plurality of GAM1413 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1413 RNA, herein designated GAM RNA, and which when bound by GAM1413 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1413 target proteins.

[19660] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1413 gene, herein designated GAM GENE, on one or more GAM1413 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19661] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1413 correlate with, and may be deduced from, the identity of the target genes which GAM1413 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19662] Nucleotide sequences of the GAM1413 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1413 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1413 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1413 are further described hereinbelow with reference to Table 1.

[19663] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1413 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19664] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1414 (GAM1414) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19665] GAM1414 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1414 was detected is described hereinabove with reference to Figs. 2-8.

[19666] GAM1414 gene, herein designated GAM GENE, and GAM1414 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19667] GAM1414 gene, herein designated GAM GENE, encodes a GAM1414 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1414 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1414 precursor RNA is designated SEQ ID:1391, and is provided hereinbelow with reference to the sequence listing part.

[19668] GAM1414 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19669] An enzyme complex designated DICER COMPLEX, dices the GAM1414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1414 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1414 RNA is designated SEQ ID:3996, and is provided hereinbelow with reference to the sequence listing part.

[19670] GAM1414 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1414 target RNA, herein designated GAM TARGET RNA. GAM1414 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19671] GAM1414 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1414 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1414 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1414 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1414 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19672] The complementary binding of GAM1414 RNA, herein designated GAM RNA, to target binding sites on GAM1414 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1414 target RNA, herein designated GAM TARGET RNA, into GAM1414 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19673] It is appreciated that GAM1414 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1414 target genes. The mRNA of each one of this plurality of GAM1414 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1414 RNA, herein designated GAM RNA, and which when bound by GAM1414 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1414 target proteins.

[19674] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1414 gene, herein designated GAM GENE, on one or more GAM1414 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19675] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1414 correlate with, and may be deduced from, the identity of the target genes which GAM1414 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19676] Nucleotide sequences of the GAM1414 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1414 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1414 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1414 are further described hereinbelow with reference to Table 1.

[19677] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1414 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19678] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1415 (GAM1415) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19679] GAM1415 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1415 was detected is described hereinabove with reference to Figs. 2-8.

[19680] GAM1415 gene, herein designated GAM GENE, and GAM1415 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19681] GAM1415 gene, herein designated GAM GENE, encodes a GAM1415 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1415 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1415 precursor RNA is designated SEQ ID:1392, and is provided hereinbelow with reference to the sequence listing part.

[19682] GAM1415 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19683] An enzyme complex designated DICER COMPLEX, dices the GAM1415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1415 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1415 RNA is designated SEQ ID:3997, and is provided hereinbelow with reference to the sequence listing part.

[19684] GAM1415 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1415 target RNA, herein designated GAM TARGET RNA. GAM1415 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19685] GAM1415 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1415 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1415 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1415 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1415 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19686] The complementary binding of GAM1415 RNA, herein designated GAM RNA, to target binding sites on GAM1415 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1415 target RNA, herein designated GAM TARGET RNA, into GAM1415 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19687] It is appreciated that GAM1415 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1415 target genes. The mRNA of each one of this plurality of GAM1415 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1415 RNA, herein designated GAM RNA, and which when bound by GAM1415 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1415 target proteins.

[19688] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1415 gene, herein designated GAM GENE, on one or more GAM1415 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19689] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1415 correlate with, and may be deduced from, the identity of the target genes which GAM1415 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19690] Nucleotide sequences of the GAM1415 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1415 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1415 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1415 are further described hereinbelow with reference to Table 1.

[19691] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1415 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19692] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1416 (GAM1416) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19693] GAM1416 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1416 was detected is described hereinabove with reference to Figs. 2-8.

[19694] GAM1416 gene, herein designated GAM GENE, and GAM1416 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19695] GAM1416 gene, herein designated GAM GENE, encodes a GAM1416 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1416 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1416 precursor RNA is designated SEQ ID:1393, and is provided hereinbelow with reference to the sequence listing part.

[19696] GAM1416 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19697] An enzyme complex designated DICER COMPLEX, dices the GAM1416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1416 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1416 RNA is designated SEQ ID:3998, and is provided hereinbelow with reference to the sequence listing part.

[19698] GAM1416 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1416 target RNA, herein designated GAM TARGET RNA. GAM1416 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19699] GAM1416 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1416 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1416 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1416 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1416 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19700] The complementary binding of GAM1416 RNA, herein designated GAM RNA, to target binding sites on GAM1416 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1416 target RNA, herein designated GAM TARGET RNA, into GAM1416 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19701] It is appreciated that GAM1416 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1416 target genes. The mRNA of each one of this plurality of GAM1416 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1416 RNA, herein designated GAM RNA, and which when bound by GAM1416 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1416 target proteins.

[19702] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1416 gene, herein designated GAM GENE, on one or more GAM1416 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19703] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1416 correlate with, and may be deduced from, the identity of the target genes which GAM1416 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19704] Nucleotide sequences of the GAM1416 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1416 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1416 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1416 are further described hereinbelow with reference to Table 1.

[19705] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1416 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19706] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1417 (GAM1417) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19707] GAM1417 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1417 was detected is described hereinabove with reference to Figs. 2-8.

[19708] GAM1417 gene, herein designated GAM GENE, and GAM1417 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19709] GAM1417 gene, herein designated GAM GENE, encodes a GAM1417 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1417 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1417 precursor RNA is designated SEQ ID:1394, and is provided hereinbelow with reference to the sequence listing part.

[19710] GAM1417 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19711] An enzyme complex designated DICER COMPLEX, dices the GAM1417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1417 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1417 RNA is designated SEQ ID:3999, and is provided hereinbelow with reference to the sequence listing part.

[19712] GAM1417 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1417 target RNA, herein designated GAM TARGET RNA. GAM1417 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19713] GAM1417 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1417 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1417 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1417 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1417 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19714] The complementary binding of GAM1417 RNA, herein designated GAM RNA, to target binding sites on GAM1417 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1417 target RNA, herein designated GAM TARGET RNA, into GAM1417 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19715] It is appreciated that GAM1417 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1417 target genes. The

mRNA of each one of this plurality of GAM1417 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1417 RNA, herein designated GAM RNA, and which when bound by GAM1417 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1417 target proteins.

[19716] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1417 gene, herein designated GAM GENE, on one or more GAM1417 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19717] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1417 correlate with, and may be deduced from, the identity of the target genes which GAM1417 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19718] Nucleotide sequences of the GAM1417 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1417 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1417 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1417 are further described hereinbelow with reference to Table 1.

[19719] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1417 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19720] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1418 (GAM1418) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19721] GAM1418 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1418 was detected is described hereinabove with reference to Figs. 2-8.

[19722] GAM1418 gene, herein designated GAM GENE, and GAM1418 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19723] GAM1418 gene, herein designated GAM GENE, encodes a GAM1418 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1418 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1418 precursor RNA is designated SEQ ID:1395, and is provided hereinbelow with reference to the sequence listing part.

[19724] GAM1418 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19725] An enzyme complex designated DICER COMPLEX, dices the GAM1418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1418 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1418 RNA is designated SEQ ID:4000, and is provided hereinbelow with reference to the sequence listing part.

[19726] GAM1418 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1418 target RNA, herein designated GAM TARGET RNA. GAM1418 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19727] GAM1418 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1418 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1418 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1418 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1418 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19728] The complementary binding of GAM1418 RNA, herein designated GAM RNA, to target binding sites on GAM1418 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1418 target RNA, herein designated GAM TARGET RNA, into GAM1418 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19729] It is appreciated that GAM1418 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1418 target genes. The mRNA of each one of this plurality of GAM1418 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1418 RNA, herein designated GAM RNA, and which when bound by GAM1418 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1418 target proteins.

[19730] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1418 gene, herein designated GAM GENE, on one or more GAM1418 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19731] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1418 correlate with, and may be deduced from, the identity of the target

genes which GAM1418 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19732] Nucleotide sequences of the GAM1418 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1418 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1418 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1418 are further described hereinbelow with reference to Table 1.

[19733] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1418 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19734] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1419 (GAM1419) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19735] GAM1419 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1419 was detected is described hereinabove with reference to Figs. 2-8.

[19736] GAM1419 gene, herein designated GAM GENE, and GAM1419 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19737] GAM1419 gene, herein designated GAM GENE, encodes a GAM1419 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1419 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1419 precursor RNA is designated SEQ ID:1396, and is provided hereinbelow with reference to the sequence listing part.

[19738] GAM1419 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19739] An enzyme complex designated DICER COMPLEX, dices the GAM1419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1419 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1419 RNA is designated SEQ ID:4001, and is provided

hereinbelow with reference to the sequence listing part.

[19740] GAM1419 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1419 target RNA, herein designated GAM TARGET RNA. GAM1419 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19741] GAM1419 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1419 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1419 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1419 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1419 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19742] The complementary binding of GAM1419 RNA, herein designated GAM RNA, to target binding sites on GAM1419 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1419 target RNA, herein designated GAM TARGET RNA, into GAM1419 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19743] It is appreciated that GAM1419 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1419 target genes. The mRNA of each one of this plurality of GAM1419 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1419 RNA, herein designated GAM RNA, and which when bound by GAM1419 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1419 target proteins.

[19744] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1419 gene, herein designated GAM GENE, on one or more GAM1419 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19745] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1419 correlate with, and may be deduced from, the identity of the target genes which GAM1419 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19746] Nucleotide sequences of the GAM1419 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1419 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1419 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1419 are further described hereinbelow with reference to Table 1.

[19747] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1419 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19748] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1420 (GAM1420) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19749] GAM1420 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1420 was detected is described hereinabove with reference to Figs. 2-8.

[19750] GAM1420 gene, herein designated GAM GENE, and GAM1420 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19751] GAM1420 gene, herein designated GAM GENE, encodes a GAM1420 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1420 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1420 precursor RNA is designated SEQ ID:1397, and is provided hereinbelow with reference to the sequence listing part.

[19752] GAM1420 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19753] An enzyme complex designated DICER COMPLEX, dices the GAM1420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1420 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1420 RNA is designated SEQ ID:4002, and is provided hereinbelow with reference to the sequence listing part.

[19754] GAM1420 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1420 target RNA, herein designated GAM TARGET RNA. GAM1420 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19755] GAM1420 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1420 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1420 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1420 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1420 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19756] The complementary binding of GAM1420 RNA, herein designated GAM RNA, to target binding sites on GAM1420 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1420 target RNA, herein designated GAM TARGET RNA, into GAM1420 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19757] It is appreciated that GAM1420 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1420 target genes. The mRNA of each one of this plurality of GAM1420 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1420 RNA, herein designated GAM RNA, and which when bound by GAM1420 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1420 target proteins.

[19758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1420 gene, herein designated GAM GENE, on one or more GAM1420 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19759] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1420 correlate with, and may be deduced from, the identity of the target genes which GAM1420 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19760] Nucleotide sequences of the GAM1420 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1420 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1420 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1420 are further described hereinbelow with reference to Table 1.

[19761] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1420 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19762] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1421 (GAM1421) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19763] GAM1421 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1421 was detected is described hereinabove with reference to Figs. 2-8.

[19764] GAM1421 gene, herein designated GAM GENE, and GAM1421 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19765] GAM1421 gene, herein designated GAM GENE, encodes a GAM1421 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1421 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1421 precursor RNA is designated SEQ ID:1398, and is provided hereinbelow with reference to the sequence listing part.

[19766] GAM1421 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19767] An enzyme complex designated DICER COMPLEX, dices the GAM1421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1421 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1421 RNA is designated SEQ ID:4004, and is provided hereinbelow with reference to the sequence listing part.

[19768] GAM1421 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1421 target RNA, herein designated GAM TARGET RNA. GAM1421 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19769] GAM1421 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1421 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1421 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1421 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1421 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19770] The complementary binding of GAM1421 RNA, herein designated GAM RNA, to target binding sites on GAM1421 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1421 target RNA, herein designated GAM TARGET RNA, into GAM1421 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19771] It is appreciated that GAM1421 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1421 target genes. The mRNA of each one of this plurality of GAM1421 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1421 RNA, herein designated GAM RNA, and which when bound by GAM1421 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1421 target proteins.

[19772] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1421 gene, herein designated GAM GENE, on one or more GAM1421 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19773] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1421 correlate with, and may be deduced from, the identity of the target genes which GAM1421 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19774] Nucleotide sequences of the GAM1421 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1421 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1421 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1421 are further described hereinbelow with reference to Table 1.

[19775] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1421 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19776] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1422 (GAM1422) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19777] GAM1422 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1422 was detected is described hereinabove with reference to Figs. 2-8.

[19778] GAM1422 gene, herein designated GAM GENE, and GAM1422 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19779] GAM1422 gene, herein designated GAM GENE, encodes a GAM1422 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1422 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1422 precursor RNA is designated SEQ ID:1399, and is provided hereinbelow with reference to the sequence listing part.

[19780] GAM1422 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19781] An enzyme complex designated DICER COMPLEX, dices the GAM1422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1422 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1422 RNA is designated SEQ ID:4003, and is provided hereinbelow with reference to the sequence listing part.

[19782] GAM1422 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1422 target RNA, herein designated GAM TARGET RNA. GAM1422 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19783] GAM1422 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1422 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1422 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1422 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1422 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19784] The complementary binding of GAM1422 RNA, herein designated GAM RNA, to target binding sites on GAM1422 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1422 target RNA, herein designated GAM TARGET RNA, into GAM1422 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19785] It is appreciated that GAM1422 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1422 target genes. The mRNA of each one of this plurality of GAM1422 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1422 RNA, herein designated GAM RNA, and which when bound by GAM1422 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1422 target proteins.

[19786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1422 gene, herein designated GAM GENE, on one or more GAM1422 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19787] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1422 correlate with, and may be deduced from, the identity of the target genes which GAM1422 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19788] Nucleotide sequences of the GAM1422 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1422 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1422 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1422 are further described hereinbelow with reference to Table 1.

[19789] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1422 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19790] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1423 (GAM1423) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19791] GAM1423 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1423 was detected is described hereinabove with reference to Figs. 2-8.

[19792] GAM1423 gene, herein designated GAM GENE, and GAM1423 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19793] GAM1423 gene, herein designated GAM GENE, encodes a GAM1423 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1423 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1423 precursor RNA is designated SEQ ID:1400, and is provided hereinbelow with reference to the sequence listing part.

[19794] GAM1423 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19795] An enzyme complex designated DICER COMPLEX, dices the GAM1423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1423 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1423 RNA is designated SEQ ID:4005, and is provided hereinbelow with reference to the sequence listing part.

[19796] GAM1423 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1423 target RNA, herein designated GAM TARGET RNA. GAM1423 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19797] GAM1423 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1423 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1423 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1423 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1423 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19798] The complementary binding of GAM1423 RNA, herein designated GAM RNA, to target binding sites on GAM1423 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1423 target RNA, herein designated GAM TARGET RNA, into GAM1423 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19799] It is appreciated that GAM1423 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1423 target genes. The

mRNA of each one of this plurality of GAM1423 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1423 RNA, herein designated GAM RNA, and which when bound by GAM1423 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1423 target proteins.

[19800] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1423 gene, herein designated GAM GENE, on one or more GAM1423 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19801] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1423 correlate with, and may be deduced from, the identity of the target genes which GAM1423 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19802] Nucleotide sequences of the GAM1423 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1423 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1423 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1423 are further described hereinbelow with reference to Table 1.

[19803] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1423 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19804] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1424 (GAM1424) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19805] GAM1424 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1424 was detected is described hereinabove with reference to Figs. 2-8.

[19806] GAM1424 gene, herein designated GAM GENE, and GAM1424 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19807] GAM1424 gene, herein designated GAM GENE, encodes a GAM1424 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1424 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1424 precursor RNA is designated SEQ ID:1401, and is provided hereinbelow with reference to the sequence listing part.

[19808] GAM1424 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19809] An enzyme complex designated DICER COMPLEX, dices the GAM1424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1424 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1424 RNA is designated SEQ ID:4006, and is provided hereinbelow with reference to the sequence listing part.

[19810] GAM1424 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1424 target RNA, herein designated GAM TARGET RNA. GAM1424 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19811] GAM1424 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1424 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1424 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1424 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1424 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19812] The complementary binding of GAM1424 RNA, herein designated GAM RNA, to target binding sites on GAM1424 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1424 target RNA, herein designated GAM TARGET RNA, into GAM1424 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19813] It is appreciated that GAM1424 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1424 target genes. The mRNA of each one of this plurality of GAM1424 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1424 RNA, herein designated GAM RNA, and which when bound by GAM1424 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1424 target proteins.

[19814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1424 gene, herein designated GAM GENE, on one or more GAM1424 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19815] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1424 correlate with, and may be deduced from, the identity of the target

genes which GAM1424 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19816] Nucleotide sequences of the GAM1424 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1424 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1424 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1424 are further described hereinbelow with reference to Table 1.

[19817] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1424 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19818] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1425 (GAM1425) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19819] GAM1425 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1425 was detected is described hereinabove with reference to Figs. 2-8.

[19820] GAM1425 gene, herein designated GAM GENE, and GAM1425 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19821] GAM1425 gene, herein designated GAM GENE, encodes a GAM1425 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1425 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1425 precursor RNA is designated SEQ ID:1402, and is provided hereinbelow with reference to the sequence listing part.

[19822] GAM1425 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19823] An enzyme complex designated DICER COMPLEX, dices the GAM1425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1425 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1425 RNA is designated SEQ ID:4007, and is provided

hereinbelow with reference to the sequence listing part.

[19824] GAM1425 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1425 target RNA, herein designated GAM TARGET RNA. GAM1425 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19825] GAM1425 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1425 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1425 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1425 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1425 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19826] The complementary binding of GAM1425 RNA, herein designated GAM RNA, to target binding sites on GAM1425 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1425 target RNA, herein designated GAM TARGET RNA, into GAM1425 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19827] It is appreciated that GAM1425 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1425 target genes. The mRNA of each one of this plurality of GAM1425 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1425 RNA, herein designated GAM RNA, and which when bound by GAM1425 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1425 target proteins.

[19828] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1425 gene, herein designated GAM GENE, on one or more GAM1425 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19829] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1425 correlate with, and may be deduced from, the identity of the target genes which GAM1425 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19830] Nucleotide sequences of the GAM1425 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1425 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1425 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1425 are further described hereinbelow with reference to Table 1.

[19831] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1425 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19832] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1426 (GAM1426) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19833] GAM1426 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1426 was detected is described hereinabove with reference to Figs. 2-8.

[19834] GAM1426 gene, herein designated GAM GENE, and GAM1426 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19835] GAM1426 gene, herein designated GAM GENE, encodes a GAM1426 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1426 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1426 precursor RNA is designated SEQ ID:1403, and is provided hereinbelow with reference to the sequence listing part.

[19836] GAM1426 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19837] An enzyme complex designated DICER COMPLEX, dices the GAM1426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1426 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1426 RNA is designated SEQ ID:4008, and is provided hereinbelow with reference to the sequence listing part.

[19838] GAM1426 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1426 target RNA, herein designated GAM TARGET RNA. GAM1426 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19839] GAM1426 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1426 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1426 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1426 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1426 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19840] The complementary binding of GAM1426 RNA, herein designated GAM RNA, to target binding sites on GAM1426 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1426 target RNA, herein designated GAM TARGET RNA, into GAM1426 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19841] It is appreciated that GAM1426 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1426 target genes. The mRNA of each one of this plurality of GAM1426 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1426 RNA, herein designated GAM RNA, and which when bound by GAM1426 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1426 target proteins.

[19842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1426 gene, herein designated GAM GENE, on one or more GAM1426 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19843] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1426 correlate with, and may be deduced from, the identity of the target genes which GAM1426 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19844] Nucleotide sequences of the GAM1426 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1426 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1426 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1426 are further described hereinbelow with reference to Table 1.

[19845] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1426 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19846] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1427 (GAM1427) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19847] GAM1427 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1427 was detected is described hereinabove with reference to Figs. 2-8.

[19848] GAM1427 gene, herein designated GAM GENE, and GAM1427 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19849] GAM1427 gene, herein designated GAM GENE, encodes a GAM1427 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1427 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1427 precursor RNA is designated SEQ ID:1404, and is provided hereinbelow with reference to the sequence listing part.

[19850] GAM1427 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19851] An enzyme complex designated DICER COMPLEX, dices the GAM1427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1427 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1427 RNA is designated SEQ ID:4010, and is provided hereinbelow with reference to the sequence listing part.

[19852] GAM1427 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1427 target RNA, herein designated GAM TARGET RNA. GAM1427 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19853] GAM1427 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1427 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1427 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1427 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1427 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19854] The complementary binding of GAM1427 RNA, herein designated GAM RNA, to target binding sites on GAM1427 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1427 target RNA, herein designated GAM TARGET RNA, into GAM1427 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19855] It is appreciated that GAM1427 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1427 target genes. The mRNA of each one of this plurality of GAM1427 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1427 RNA, herein designated GAM RNA, and which when bound by GAM1427 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1427 target proteins.

[19856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1427 gene, herein designated GAM GENE, on one or more GAM1427 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19857] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1427 correlate with, and may be deduced from, the identity of the target genes which GAM1427 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19858] Nucleotide sequences of the GAM1427 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1427 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1427 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1427 are further described hereinbelow with reference to Table 1.

[19859] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1427 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19860] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1428 (GAM1428) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19861] GAM1428 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1428 was detected is described hereinabove with reference to Figs. 2-8.

[19862] GAM1428 gene, herein designated GAM GENE, and GAM1428 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19863] GAM1428 gene, herein designated GAM GENE, encodes a GAM1428 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1428 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1428 precursor RNA is designated SEQ ID:1405, and is provided hereinbelow with reference to the sequence listing part.

[19864] GAM1428 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19865] An enzyme complex designated DICER COMPLEX, dices the GAM1428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1428 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1428 RNA is designated SEQ ID:4009, and is provided hereinbelow with reference to the sequence listing part.

[19866] GAM1428 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1428 target RNA, herein designated GAM TARGET RNA. GAM1428 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19867] GAM1428 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1428 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1428 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1428 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1428 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19868] The complementary binding of GAM1428 RNA, herein designated GAM RNA, to target binding sites on GAM1428 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1428 target RNA, herein designated GAM TARGET RNA, into GAM1428 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19869] It is appreciated that GAM1428 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1428 target genes. The mRNA of each one of this plurality of GAM1428 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1428 RNA, herein designated GAM RNA, and which when bound by GAM1428 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1428 target proteins.

[19870] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1428 gene, herein designated GAM GENE, on one or more GAM1428 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19871] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1428 correlate with, and may be deduced from, the identity of the target genes which GAM1428 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19872] Nucleotide sequences of the GAM1428 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1428 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1428 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1428 are further described hereinbelow with reference to Table 1.

[19873] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1428 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19874] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1429 (GAM1429) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19875] GAM1429 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1429 was detected is described hereinabove with reference to Figs. 2-8.

[19876] GAM1429 gene, herein designated GAM GENE, and GAM1429 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19877] GAM1429 gene, herein designated GAM GENE, encodes a GAM1429 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1429 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1429 precursor RNA is designated SEQ ID:1406, and is provided hereinbelow with reference to the sequence listing part.

[19878] GAM1429 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19879] An enzyme complex designated DICER COMPLEX, dices the GAM1429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1429 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1429 RNA is designated SEQ ID:4011, and is provided hereinbelow with reference to the sequence listing part.

[19880] GAM1429 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1429 target RNA, herein designated GAM TARGET RNA. GAM1429 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19881] GAM1429 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1429 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1429 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1429 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1429 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19882] The complementary binding of GAM1429 RNA, herein designated GAM RNA, to target binding sites on GAM1429 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1429 target RNA, herein designated GAM TARGET RNA, into GAM1429 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19883] It is appreciated that GAM1429 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1429 target genes. The

mRNA of each one of this plurality of GAM1429 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1429 RNA, herein designated GAM RNA, and which when bound by GAM1429 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1429 target proteins.

[19884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1429 gene, herein designated GAM GENE, on one or more GAM1429 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19885] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1429 correlate with, and may be deduced from, the identity of the target genes which GAM1429 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19886] Nucleotide sequences of the GAM1429 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1429 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1429 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1429 are further described hereinbelow with reference to Table 1.

[19887] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1429 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19888] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1430 (GAM1430) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19889] GAM1430 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1430 was detected is described hereinabove with reference to Figs. 2-8.

[19890] GAM1430 gene, herein designated GAM GENE, and GAM1430 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19891] GAM1430 gene, herein designated GAM GENE, encodes a GAM1430 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1430 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1430 precursor RNA is designated SEQ ID:1407, and is provided hereinbelow with reference to the sequence listing part.

[19892] GAM1430 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19893] An enzyme complex designated DICER COMPLEX, dices the GAM1430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1430 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1430 RNA is designated SEQ ID:4012, and is provided hereinbelow with reference to the sequence listing part.

[19894] GAM1430 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1430 target RNA, herein designated GAM TARGET RNA. GAM1430 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19895] GAM1430 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1430 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1430 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1430 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1430 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19896] The complementary binding of GAM1430 RNA, herein designated GAM RNA, to target binding sites on GAM1430 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1430 target RNA, herein designated GAM TARGET RNA, into GAM1430 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19897] It is appreciated that GAM1430 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1430 target genes. The mRNA of each one of this plurality of GAM1430 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1430 RNA, herein designated GAM RNA, and which when bound by GAM1430 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1430 target proteins.

[19898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1430 gene, herein designated GAM GENE, on one or more GAM1430 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19899] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1430 correlate with, and may be deduced from, the identity of the target

genes which GAM1430 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19900] Nucleotide sequences of the GAM1430 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1430 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1430 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1430 are further described hereinbelow with reference to Table 1.

[19901] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1430 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19902] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1431 (GAM1431) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19903] GAM1431 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1431 was detected is described hereinabove with reference to Figs. 2-8.

[19904] GAM1431 gene, herein designated GAM GENE, and GAM1431 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19905] GAM1431 gene, herein designated GAM GENE, encodes a GAM1431 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1431 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1431 precursor RNA is designated SEQ ID:1408, and is provided hereinbelow with reference to the sequence listing part.

[19906] GAM1431 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19907] An enzyme complex designated DICER COMPLEX, dices the GAM1431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1431 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1431 RNA is designated SEQ ID:4013, and is provided

hereinbelow with reference to the sequence listing part.

[19908] GAM1431 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1431 target RNA, herein designated GAM TARGET RNA. GAM1431 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19909] GAM1431 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1431 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1431 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1431 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1431 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19910] The complementary binding of GAM1431 RNA, herein designated GAM RNA, to target binding sites on GAM1431 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1431 target RNA, herein designated GAM TARGET RNA, into GAM1431 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19911] It is appreciated that GAM1431 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1431 target genes. The mRNA of each one of this plurality of GAM1431 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1431 RNA, herein designated GAM RNA, and which when bound by GAM1431 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1431 target proteins.

[19912] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1431 gene, herein designated GAM GENE, on one or more GAM1431 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19913] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1431 correlate with, and may be deduced from, the identity of the target genes which GAM1431 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19914] Nucleotide sequences of the GAM1431 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1431 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1431 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1431 are further described hereinbelow with reference to Table 1.

[19915] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1431 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19916] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1432 (GAM1432) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19917] GAM1432 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1432 was detected is described hereinabove with reference to Figs. 2-8.

[19918] GAM1432 gene, herein designated GAM GENE, and GAM1432 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19919] GAM1432 gene, herein designated GAM GENE, encodes a GAM1432 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1432 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1432 precursor RNA is designated SEQ ID:1409, and is provided hereinbelow with reference to the sequence listing part.

[19920] GAM1432 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19921] An enzyme complex designated DICER COMPLEX, dices the GAM1432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1432 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1432 RNA is designated SEQ ID:4014, and is provided hereinbelow with reference to the sequence listing part.

[19922] GAM1432 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1432 target RNA, herein designated GAM TARGET RNA. GAM1432 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19923] GAM1432 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1432 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1432 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1432 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1432 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19924] The complementary binding of GAM1432 RNA, herein designated GAM RNA, to target binding sites on GAM1432 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1432 target RNA, herein designated GAM TARGET RNA, into GAM1432 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19925] It is appreciated that GAM1432 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1432 target genes. The mRNA of each one of this plurality of GAM1432 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1432 RNA, herein designated GAM RNA, and which when bound by GAM1432 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1432 target proteins.

[19926] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1432 gene, herein designated GAM GENE, on one or more GAM1432 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19927] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1432 correlate with, and may be deduced from, the identity of the target genes which GAM1432 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19928] Nucleotide sequences of the GAM1432 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1432 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1432 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1432 are further described hereinbelow with reference to Table 1.

[19929] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1432 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19930] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1433 (GAM1433) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19931] GAM1433 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1433 was detected is described hereinabove with reference to Figs. 2-8.

[19932] GAM1433 gene, herein designated GAM GENE, and GAM1433 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19933] GAM1433 gene, herein designated GAM GENE, encodes a GAM1433 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1433 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1433 precursor RNA is designated SEQ ID:1410, and is provided hereinbelow with reference to the sequence listing part.

[19934] GAM1433 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19935] An enzyme complex designated DICER COMPLEX, dices the GAM1433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1433 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1433 RNA is designated SEQ ID:4016, and is provided hereinbelow with reference to the sequence listing part.

[19936] GAM1433 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1433 target RNA, herein designated GAM TARGET RNA. GAM1433 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19937] GAM1433 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1433 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1433 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1433 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1433 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19938] The complementary binding of GAM1433 RNA, herein designated GAM RNA, to target binding sites on GAM1433 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1433 target RNA, herein designated GAM TARGET RNA, into GAM1433 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19939] It is appreciated that GAM1433 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1433 target genes. The mRNA of each one of this plurality of GAM1433 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1433 RNA, herein designated GAM RNA, and which when bound by GAM1433 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1433 target proteins.

[19940] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1433 gene, herein designated GAM GENE, on one or more GAM1433 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19941] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1433 correlate with, and may be deduced from, the identity of the target genes which GAM1433 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19942] Nucleotide sequences of the GAM1433 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1433 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1433 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1433 are further described hereinbelow with reference to Table 1.

[19943] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1433 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[19944] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1434 (GAM1434) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19945] GAM1434 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1434 was detected is described hereinabove with reference to Figs. 2-8.

[19946] GAM1434 gene, herein designated GAM GENE, and GAM1434 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19947] GAM1434 gene, herein designated GAM GENE, encodes a GAM1434 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1434 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1434 precursor RNA is designated SEQ ID:1411, and is provided hereinbelow with reference to the sequence listing part.

[19948] GAM1434 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19949] An enzyme complex designated DICER COMPLEX, dices the GAM1434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1434 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1434 RNA is designated SEQ ID:4015, and is provided hereinbelow with reference to the sequence listing part.

[19950] GAM1434 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1434 target RNA, herein designated GAM TARGET RNA. GAM1434 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19951] GAM1434 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1434 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1434 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1434 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1434 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19952] The complementary binding of GAM1434 RNA, herein designated GAM RNA, to target binding sites on GAM1434 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1434 target RNA, herein designated GAM TARGET RNA, into GAM1434 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19953] It is appreciated that GAM1434 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1434 target genes. The mRNA of each one of this plurality of GAM1434 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1434 RNA, herein designated GAM RNA, and which when bound by GAM1434 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1434 target proteins.

[19954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1434 gene, herein designated GAM GENE, on one or more GAM1434 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19955] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1434 correlate with, and may be deduced from, the identity of the target genes which GAM1434 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19956] Nucleotide sequences of the GAM1434 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1434 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1434 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1434 are further described hereinbelow with reference to Table 1.

[19957] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1434 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19958] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1435 (GAM1435) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19959] GAM1435 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1435 was detected is described hereinabove with reference to Figs. 2-8.

[19960] GAM1435 gene, herein designated GAM GENE, and GAM1435 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19961] GAM1435 gene, herein designated GAM GENE, encodes a GAM1435 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1435 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1435 precursor RNA is designated SEQ ID:1412, and is provided hereinbelow with reference to the sequence listing part.

[19962] GAM1435 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19963] An enzyme complex designated DICER COMPLEX, dices the GAM1435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1435 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1435 RNA is designated SEQ ID:4018, and is provided hereinbelow with reference to the sequence listing part.

[19964] GAM1435 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1435 target RNA, herein designated GAM TARGET RNA. GAM1435 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19965] GAM1435 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1435 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1435 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1435 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1435 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19966] The complementary binding of GAM1435 RNA, herein designated GAM RNA, to target binding sites on GAM1435 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1435 target RNA, herein designated GAM TARGET RNA, into GAM1435 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19967] It is appreciated that GAM1435 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1435 target genes. The

mRNA of each one of this plurality of GAM1435 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1435 RNA, herein designated GAM RNA, and which when bound by GAM1435 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1435 target proteins.

[19968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1435 gene, herein designated GAM GENE, on one or more GAM1435 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19969] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1435 correlate with, and may be deduced from, the identity of the target genes which GAM1435 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19970] Nucleotide sequences of the GAM1435 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1435 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1435 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1435 are further described hereinbelow with reference to Table 1.

[19971] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1435 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19972] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1436 (GAM1436) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19973] GAM1436 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1436 was detected is described hereinabove with reference to Figs. 2-8.

[19974] GAM1436 gene, herein designated GAM GENE, and GAM1436 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[19975] GAM1436 gene, herein designated GAM GENE, encodes a GAM1436 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1436 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1436 precursor RNA is designated SEQ ID:1413, and is provided hereinbelow with reference to the sequence listing part.

[19976] GAM1436 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19977] An enzyme complex designated DICER COMPLEX, dices the GAM1436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1436 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1436 RNA is designated SEQ ID:4017, and is provided hereinbelow with reference to the sequence listing part.

[19978] GAM1436 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1436 target RNA, herein designated GAM TARGET RNA. GAM1436 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19979] GAM1436 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1436 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1436 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1436 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1436 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19980] The complementary binding of GAM1436 RNA, herein designated GAM RNA, to target binding sites on GAM1436 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1436 target RNA, herein designated GAM TARGET RNA, into GAM1436 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19981] It is appreciated that GAM1436 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1436 target genes. The mRNA of each one of this plurality of GAM1436 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1436 RNA, herein designated GAM RNA, and which when bound by GAM1436 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1436 target proteins.

[19982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1436 gene, herein designated GAM GENE, on one or more GAM1436 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19983] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1436 correlate with, and may be deduced from, the identity of the target

genes which GAM1436 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19984] Nucleotide sequences of the GAM1436 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1436 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1436 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1436 are further described hereinbelow with reference to Table 1.

[19985] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1436 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[19986] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1437 (GAM1437) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[19987] GAM1437 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1437 was detected is described hereinabove with reference to Figs. 2-8.

[19988] GAM1437 gene, herein designated GAM GENE, and GAM1437 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[19989] GAM1437 gene, herein designated GAM GENE, encodes a GAM1437 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1437 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1437 precursor RNA is designated SEQ ID:1414, and is provided hereinbelow with reference to the sequence listing part.

[19990] GAM1437 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19991] An enzyme complex designated DICER COMPLEX, dices the GAM1437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1437 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1437 RNA is designated SEQ ID:4019, and is provided

hereinbelow with reference to the sequence listing part.

[19992] GAM1437 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1437 target RNA, herein designated GAM TARGET RNA. GAM1437 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19993] GAM1437 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1437 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1437 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1437 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1437 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19994] The complementary binding of GAM1437 RNA, herein designated GAM RNA, to target binding sites on GAM1437 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1437 target RNA, herein designated GAM TARGET RNA, into GAM1437 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[19995] It is appreciated that GAM1437 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1437 target genes. The mRNA of each one of this plurality of GAM1437 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1437 RNA, herein designated GAM RNA, and which when bound by GAM1437 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1437 target proteins.

[19996] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1437 gene, herein designated GAM GENE, on one or more GAM1437 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19997] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1437 correlate with, and may be deduced from, the identity of the target genes which GAM1437 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19998] Nucleotide sequences of the GAM1437 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1437 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1437 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1437 are further described hereinbelow with reference to Table 1.

[19999] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1437 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20000] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1438 (GAM1438) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20001] GAM1438 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1438 was detected is described hereinabove with reference to Figs. 2-8.

[20002] GAM1438 gene, herein designated GAM GENE, and GAM1438 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20003] GAM1438 gene, herein designated GAM GENE, encodes a GAM1438 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1438 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1438 precursor RNA is designated SEQ ID:1415, and is provided hereinbelow with reference to the sequence listing part.

[20004] GAM1438 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20005] An enzyme complex designated DICER COMPLEX, dices the GAM1438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1438 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1438 RNA is designated SEQ ID:4020, and is provided hereinbelow with reference to the sequence listing part.

[20006] GAM1438 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1438 target RNA, herein designated GAM TARGET RNA. GAM1438 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20007] GAM1438 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1438 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1438 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1438 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1438 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20008] The complementary binding of GAM1438 RNA, herein designated GAM RNA, to target binding sites on GAM1438 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1438 target RNA, herein designated GAM TARGET RNA, into GAM1438 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20009] It is appreciated that GAM1438 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1438 target genes. The mRNA of each one of this plurality of GAM1438 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1438 RNA, herein designated GAM RNA, and which when bound by GAM1438 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1438 target proteins.

[20010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1438 gene, herein designated GAM GENE, on one or more GAM1438 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20011] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1438 correlate with, and may be deduced from, the identity of the target genes which GAM1438 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20012] Nucleotide sequences of the GAM1438 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1438 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1438 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1438 are further described hereinbelow with reference to Table 1.

[20013] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1438 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20014] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1439 (GAM1439) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20015] GAM1439 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1439 was detected is described hereinabove with reference to Figs. 2-8.

[20016] GAM1439 gene, herein designated GAM GENE, and GAM1439 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20017] GAM1439 gene, herein designated GAM GENE, encodes a GAM1439 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1439 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1439 precursor RNA is designated SEQ ID:1416, and is provided hereinbelow with reference to the sequence listing part.

[20018] GAM1439 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20019] An enzyme complex designated DICER COMPLEX, dices the GAM1439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1439 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1439 RNA is designated SEQ ID:4021, and is provided hereinbelow with reference to the sequence listing part.

[20020] GAM1439 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1439 target RNA, herein designated GAM TARGET RNA. GAM1439 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20021] GAM1439 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1439 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1439 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1439 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1439 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20022] The complementary binding of GAM1439 RNA, herein designated GAM RNA, to target binding sites on GAM1439 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1439 target RNA, herein designated GAM TARGET RNA, into GAM1439 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20023] It is appreciated that GAM1439 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1439 target genes. The mRNA of each one of this plurality of GAM1439 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1439 RNA, herein designated GAM RNA, and which when bound by GAM1439 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1439 target proteins.

[20024] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1439 gene, herein designated GAM GENE, on one or more GAM1439 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20025] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1439 correlate with, and may be deduced from, the identity of the target genes which GAM1439 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20026] Nucleotide sequences of the GAM1439 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1439 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1439 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1439 are further described hereinbelow with reference to Table 1.

[20027] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1439 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20028] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1440 (GAM1440) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20029] GAM1440 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1440 was detected is described hereinabove with reference to Figs. 2-8.

[20030] GAM1440 gene, herein designated GAM GENE, and GAM1440 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20031] GAM1440 gene, herein designated GAM GENE, encodes a GAM1440 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1440 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1440 precursor RNA is designated SEQ ID:1417, and is provided hereinbelow with reference to the sequence listing part.

[20032] GAM1440 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20033] An enzyme complex designated DICER COMPLEX, dices the GAM1440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1440 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1440 RNA is designated SEQ ID:4023, and is provided hereinbelow with reference to the sequence listing part.

[20034] GAM1440 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1440 target RNA, herein designated GAM TARGET RNA. GAM1440 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20035] GAM1440 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1440 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1440 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1440 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1440 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20036] The complementary binding of GAM1440 RNA, herein designated GAM RNA, to target binding sites on GAM1440 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1440 target RNA, herein designated GAM TARGET RNA, into GAM1440 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20037] It is appreciated that GAM1440 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1440 target genes. The mRNA of each one of this plurality of GAM1440 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1440 RNA, herein designated GAM RNA, and which when bound by GAM1440 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1440 target proteins.

[20038] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1440 gene, herein designated GAM GENE, on one or more GAM1440 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20039] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1440 correlate with, and may be deduced from, the identity of the target genes which GAM1440 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20040] Nucleotide sequences of the GAM1440 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1440 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1440 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1440 are further described hereinbelow with reference to Table 1.

[20041] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1440 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20042] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1441 (GAM1441) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20043] GAM1441 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1441 was detected is described hereinabove with reference to Figs. 2-8.

[20044] GAM1441 gene, herein designated GAM GENE, and GAM1441 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20045] GAM1441 gene, herein designated GAM GENE, encodes a GAM1441 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1441 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1441 precursor RNA is designated SEQ ID:1418, and is provided hereinbelow with reference to the sequence listing part.

[20046] GAM1441 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20047] An enzyme complex designated DICER COMPLEX, dices the GAM1441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1441 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1441 RNA is designated SEQ ID:4022, and is provided hereinbelow with reference to the sequence listing part.

[20048] GAM1441 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1441 target RNA, herein designated GAM TARGET RNA. GAM1441 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20049] GAM1441 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1441 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1441 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1441 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1441 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20050] The complementary binding of GAM1441 RNA, herein designated GAM RNA, to target binding sites on GAM1441 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1441 target RNA, herein designated GAM TARGET RNA, into GAM1441 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20051] It is appreciated that GAM1441 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1441 target genes. The

mRNA of each one of this plurality of GAM1441 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1441 RNA, herein designated GAM RNA, and which when bound by GAM1441 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1441 target proteins.

[20052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1441 gene, herein designated GAM GENE, on one or more GAM1441 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20053] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1441 correlate with, and may be deduced from, the identity of the target genes which GAM1441 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20054] Nucleotide sequences of the GAM1441 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1441 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1441 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1441 are further described hereinbelow with reference to Table 1.

[20055] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1441 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20056] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1442 (GAM1442) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20057] GAM1442 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1442 was detected is described hereinabove with reference to Figs. 2-8.

[20058] GAM1442 gene, herein designated GAM GENE, and GAM1442 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20059] GAM1442 gene, herein designated GAM GENE, encodes a GAM1442 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1442 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1442 precursor RNA is designated SEQ ID:1419, and is provided hereinbelow with reference to the sequence listing part.

[20060] GAM1442 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20061] An enzyme complex designated DICER COMPLEX, dices the GAM1442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1442 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1442 RNA is designated SEQ ID:4024, and is provided hereinbelow with reference to the sequence listing part.

[20062] GAM1442 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1442 target RNA, herein designated GAM TARGET RNA. GAM1442 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20063] GAM1442 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1442 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1442 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1442 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1442 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20064] The complementary binding of GAM1442 RNA, herein designated GAM RNA, to target binding sites on GAM1442 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1442 target RNA, herein designated GAM TARGET RNA, into GAM1442 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20065] It is appreciated that GAM1442 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1442 target genes. The mRNA of each one of this plurality of GAM1442 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1442 RNA, herein designated GAM RNA, and which when bound by GAM1442 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1442 target proteins.

[20066] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1442 gene, herein designated GAM GENE, on one or more GAM1442 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20067] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1442 correlate with, and may be deduced from, the identity of the target

genes which GAM1442 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20068] Nucleotide sequences of the GAM1442 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1442 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1442 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1442 are further described hereinbelow with reference to Table 1.

[20069] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1442 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20070] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1443 (GAM1443) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20071] GAM1443 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1443 was detected is described hereinabove with reference to Figs. 2-8.

[20072] GAM1443 gene, herein designated GAM GENE, and GAM1443 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20073] GAM1443 gene, herein designated GAM GENE, encodes a GAM1443 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1443 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1443 precursor RNA is designated SEQ ID:1420, and is provided hereinbelow with reference to the sequence listing part.

[20074] GAM1443 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20075] An enzyme complex designated DICER COMPLEX, dices the GAM1443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1443 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1443 RNA is designated SEQ ID:4025, and is provided

hereinbelow with reference to the sequence listing part.

[20076] GAM1443 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1443 target RNA, herein designated GAM TARGET RNA. GAM1443 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20077] GAM1443 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1443 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1443 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1443 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1443 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20078] The complementary binding of GAM1443 RNA, herein designated GAM RNA, to target binding sites on GAM1443 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1443 target RNA, herein designated GAM TARGET RNA, into GAM1443 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20079] It is appreciated that GAM1443 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1443 target genes. The mRNA of each one of this plurality of GAM1443 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1443 RNA, herein designated GAM RNA, and which when bound by GAM1443 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1443 target proteins.

[20080] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1443 gene, herein designated GAM GENE, on one or more GAM1443 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20081] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1443 correlate with, and may be deduced from, the identity of the target genes which GAM1443 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20082] Nucleotide sequences of the GAM1443 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1443 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1443 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1443 are further described hereinbelow with reference to Table 1.

[20083] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1443 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20084] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1444 (GAM1444) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20085] GAM1444 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1444 was detected is described hereinabove with reference to Figs. 2-8.

[20086] GAM1444 gene, herein designated GAM GENE, and GAM1444 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20087] GAM1444 gene, herein designated GAM GENE, encodes a GAM1444 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1444 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1444 precursor RNA is designated SEQ ID:1421, and is provided hereinbelow with reference to the sequence listing part.

[20088] GAM1444 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20089] An enzyme complex designated DICER COMPLEX, dices the GAM1444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1444 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1444 RNA is designated SEQ ID:4026, and is provided hereinbelow with reference to the sequence listing part.

[20090] GAM1444 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1444 target RNA, herein designated GAM TARGET RNA. GAM1444 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20091] GAM1444 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1444 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1444 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1444 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1444 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20092] The complementary binding of GAM1444 RNA, herein designated GAM RNA, to target binding sites on GAM1444 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1444 target RNA, herein designated GAM TARGET RNA, into GAM1444 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20093] It is appreciated that GAM1444 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1444 target genes. The mRNA of each one of this plurality of GAM1444 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1444 RNA, herein designated GAM RNA, and which when bound by GAM1444 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1444 target proteins.

[20094] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1444 gene, herein designated GAM GENE, on one or more GAM1444 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20095] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1444 correlate with, and may be deduced from, the identity of the target genes which GAM1444 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20096] Nucleotide sequences of the GAM1444 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1444 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1444 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1444 are further described hereinbelow with reference to Table 1.

[20097] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1444 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20098] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1445 (GAM1445) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20099] GAM1445 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1445 was detected is described hereinabove with reference to Figs. 2-8.

[20100] GAM1445 gene, herein designated GAM GENE, and GAM1445 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20101] GAM1445 gene, herein designated GAM GENE, encodes a GAM1445 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1445 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1445 precursor RNA is designated SEQ ID:1422, and is provided hereinbelow with reference to the sequence listing part.

[20102] GAM1445 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20103] An enzyme complex designated DICER COMPLEX, dices the GAM1445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1445 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1445 RNA is designated SEQ ID:4027, and is provided hereinbelow with reference to the sequence listing part.

[20104] GAM1445 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1445 target RNA, herein designated GAM TARGET RNA. GAM1445 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20105] GAM1445 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1445 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1445 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1445 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1445 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20106] The complementary binding of GAM1445 RNA, herein designated GAM RNA, to target binding sites on GAM1445 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1445 target RNA, herein designated GAM TARGET RNA, into GAM1445 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20107] It is appreciated that GAM1445 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1445 target genes. The mRNA of each one of this plurality of GAM1445 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1445 RNA, herein designated GAM RNA, and which when bound by GAM1445 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1445 target proteins.

[20108] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1445 gene, herein designated GAM GENE, on one or more GAM1445 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20109] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1445 correlate with, and may be deduced from, the identity of the target genes which GAM1445 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20110] Nucleotide sequences of the GAM1445 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1445 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1445 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1445 are further described hereinbelow with reference to Table 1.

[20111] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1445 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20112] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1446 (GAM1446) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20113] GAM1446 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1446 was detected is described hereinabove with reference to Figs. 2-8.

[20114] GAM1446 gene, herein designated GAM GENE, and GAM1446 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20115] GAM1446 gene, herein designated GAM GENE, encodes a GAM1446 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1446 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1446 precursor RNA is designated SEQ ID:1423, and is provided hereinbelow with reference to the sequence listing part.

[20116] GAM1446 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20117] An enzyme complex designated DICER COMPLEX, dices the GAM1446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1446 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1446 RNA is designated SEQ ID:4029, and is provided hereinbelow with reference to the sequence listing part.

[20118] GAM1446 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1446 target RNA, herein designated GAM TARGET RNA. GAM1446 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20119] GAM1446 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1446 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1446 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1446 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1446 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20120] The complementary binding of GAM1446 RNA, herein designated GAM RNA, to target binding sites on GAM1446 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1446 target RNA, herein designated GAM TARGET RNA, into GAM1446 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20121] It is appreciated that GAM1446 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1446 target genes. The mRNA of each one of this plurality of GAM1446 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1446 RNA, herein designated GAM RNA, and which when bound by GAM1446 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1446 target proteins.

[20122] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1446 gene, herein designated GAM GENE, on one or more GAM1446 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20123] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1446 correlate with, and may be deduced from, the identity of the target genes which GAM1446 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20124] Nucleotide sequences of the GAM1446 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1446 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1446 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1446 are further described hereinbelow with reference to Table 1.

[20125] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1446 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20126] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1447 (GAM1447) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20127] GAM1447 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1447 was detected is described hereinabove with reference to Figs. 2-8.

[20128] GAM1447 gene, herein designated GAM GENE, and GAM1447 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20129] GAM1447 gene, herein designated GAM GENE, encodes a GAM1447 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1447 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1447 precursor RNA is designated SEQ ID:1424, and is provided hereinbelow with reference to the sequence listing part.

[20130] GAM1447 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20131] An enzyme complex designated DICER COMPLEX, dices the GAM1447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1447 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1447 RNA is designated SEQ ID:4028, and is provided hereinbelow with reference to the sequence listing part.

[20132] GAM1447 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1447 target RNA, herein designated GAM TARGET RNA. GAM1447 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20133] GAM1447 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1447 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1447 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1447 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1447 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20134] The complementary binding of GAM1447 RNA, herein designated GAM RNA, to target binding sites on GAM1447 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1447 target RNA, herein designated GAM TARGET RNA, into GAM1447 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20135] It is appreciated that GAM1447 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1447 target genes. The

mRNA of each one of this plurality of GAM1447 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1447 RNA, herein designated GAM RNA, and which when bound by GAM1447 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1447 target proteins.

[20136] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1447 gene, herein designated GAM GENE, on one or more GAM1447 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20137] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1447 correlate with, and may be deduced from, the identity of the target genes which GAM1447 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20138] Nucleotide sequences of the GAM1447 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1447 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1447 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1447 are further described hereinbelow with reference to Table 1.

[20139] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1447 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20140] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1448 (GAM1448) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20141] GAM1448 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1448 was detected is described hereinabove with reference to Figs. 2-8.

[20142] GAM1448 gene, herein designated GAM GENE, and GAM1448 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20143] GAM1448 gene, herein designated GAM GENE, encodes a GAM1448 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1448 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1448 precursor RNA is designated SEQ ID:1425, and is provided hereinbelow with reference to the sequence listing part.

[20144] GAM1448 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20145] An enzyme complex designated DICER COMPLEX, dices the GAM1448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1448 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1448 RNA is designated SEQ ID:4030, and is provided hereinbelow with reference to the sequence listing part.

[20146] GAM1448 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1448 target RNA, herein designated GAM TARGET RNA. GAM1448 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20147] GAM1448 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1448 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1448 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1448 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1448 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20148] The complementary binding of GAM1448 RNA, herein designated GAM RNA, to target binding sites on GAM1448 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1448 target RNA, herein designated GAM TARGET RNA, into GAM1448 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20149] It is appreciated that GAM1448 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1448 target genes. The mRNA of each one of this plurality of GAM1448 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1448 RNA, herein designated GAM RNA, and which when bound by GAM1448 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1448 target proteins.

[20150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1448 gene, herein designated GAM GENE, on one or more GAM1448 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20151] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1448 correlate with, and may be deduced from, the identity of the target

genes which GAM1448 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20152] Nucleotide sequences of the GAM1448 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1448 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1448 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1448 are further described hereinbelow with reference to Table 1.

[20153] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1448 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20154] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1449 (GAM1449) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20155] GAM1449 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1449 was detected is described hereinabove with reference to Figs. 2-8.

[20156] GAM1449 gene, herein designated GAM GENE, and GAM1449 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20157] GAM1449 gene, herein designated GAM GENE, encodes a GAM1449 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1449 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1449 precursor RNA is designated SEQ ID:1426, and is provided hereinbelow with reference to the sequence listing part.

[20158] GAM1449 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20159] An enzyme complex designated DICER COMPLEX, dices the GAM1449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1449 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1449 RNA is designated SEQ ID:4031, and is provided

hereinbelow with reference to the sequence listing part.

[20160] GAM1449 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1449 target RNA, herein designated GAM TARGET RNA. GAM1449 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20161] GAM1449 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1449 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1449 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1449 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1449 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20162] The complementary binding of GAM1449 RNA, herein designated GAM RNA, to target binding sites on GAM1449 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1449 target RNA, herein designated GAM TARGET RNA, into GAM1449 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20163] It is appreciated that GAM1449 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1449 target genes. The mRNA of each one of this plurality of GAM1449 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1449 RNA, herein designated GAM RNA, and which when bound by GAM1449 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1449 target proteins.

[20164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1449 gene, herein designated GAM GENE, on one or more GAM1449 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20165] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1449 correlate with, and may be deduced from, the identity of the target genes which GAM1449 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20166] Nucleotide sequences of the GAM1449 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1449 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1449 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1449 are further described hereinbelow with reference to Table 1.

[20167] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1449 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20168] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1450 (GAM1450) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20169] GAM1450 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1450 was detected is described hereinabove with reference to Figs. 2-8.

[20170] GAM1450 gene, herein designated GAM GENE, and GAM1450 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20171] GAM1450 gene, herein designated GAM GENE, encodes a GAM1450 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1450 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1450 precursor RNA is designated SEQ ID:1427, and is provided hereinbelow with reference to the sequence listing part.

[20172] GAM1450 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20173] An enzyme complex designated DICER COMPLEX, dices the GAM1450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1450 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1450 RNA is designated SEQ ID:4032, and is provided hereinbelow with reference to the sequence listing part.

[20174] GAM1450 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1450 target RNA, herein designated GAM TARGET RNA. GAM1450 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20175] GAM1450 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1450 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1450 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1450 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1450 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20176] The complementary binding of GAM1450 RNA, herein designated GAM RNA, to target binding sites on GAM1450 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1450 target RNA, herein designated GAM TARGET RNA, into GAM1450 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20177] It is appreciated that GAM1450 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1450 target genes. The mRNA of each one of this plurality of GAM1450 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1450 RNA, herein designated GAM RNA, and which when bound by GAM1450 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1450 target proteins.

[20178] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1450 gene, herein designated GAM GENE, on one or more GAM1450 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20179] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1450 correlate with, and may be deduced from, the identity of the target genes which GAM1450 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20180] Nucleotide sequences of the GAM1450 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1450 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1450 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1450 are further described hereinbelow with reference to Table 1.

[20181] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1450 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20182] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1451 (GAM1451) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20183] GAM1451 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1451 was detected is described hereinabove with reference to Figs. 2-8.

[20184] GAM1451 gene, herein designated GAM GENE, and GAM1451 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20185] GAM1451 gene, herein designated GAM GENE, encodes a GAM1451 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1451 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1451 precursor RNA is designated SEQ ID:1428, and is provided hereinbelow with reference to the sequence listing part.

[20186] GAM1451 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20187] An enzyme complex designated DICER COMPLEX, dices the GAM1451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1451 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1451 RNA is designated SEQ ID:4033, and is provided hereinbelow with reference to the sequence listing part.

[20188] GAM1451 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1451 target RNA, herein designated GAM TARGET RNA. GAM1451 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20189] GAM1451 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1451 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1451 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1451 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1451 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20190] The complementary binding of GAM1451 RNA, herein designated GAM RNA, to target binding sites on GAM1451 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1451 target RNA, herein designated GAM TARGET RNA, into GAM1451 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20191] It is appreciated that GAM1451 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1451 target genes. The mRNA of each one of this plurality of GAM1451 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1451 RNA, herein designated GAM RNA, and which when bound by GAM1451 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1451 target proteins.

[20192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1451 gene, herein designated GAM GENE, on one or more GAM1451 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20193] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1451 correlate with, and may be deduced from, the identity of the target genes which GAM1451 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20194] Nucleotide sequences of the GAM1451 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1451 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1451 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1451 are further described hereinbelow with reference to Table 1.

[20195] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1451 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20196] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1452 (GAM1452) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20197] GAM1452 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1452 was detected is described hereinabove with reference to Figs. 2-8.

[20198] GAM1452 gene, herein designated GAM GENE, and GAM1452 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20199] GAM1452 gene, herein designated GAM GENE, encodes a GAM1452 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1452 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1452 precursor RNA is designated SEQ ID:1429, and is provided hereinbelow with reference to the sequence listing part.

[20200] GAM1452 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20201] An enzyme complex designated DICER COMPLEX, dices the GAM1452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1452 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1452 RNA is designated SEQ ID:4034, and is provided hereinbelow with reference to the sequence listing part.

[20202] GAM1452 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1452 target RNA, herein designated GAM TARGET RNA. GAM1452 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20203] GAM1452 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1452 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1452 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1452 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1452 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20204] The complementary binding of GAM1452 RNA, herein designated GAM RNA, to target binding sites on GAM1452 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1452 target RNA, herein designated GAM TARGET RNA, into GAM1452 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20205] It is appreciated that GAM1452 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1452 target genes. The mRNA of each one of this plurality of GAM1452 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1452 RNA, herein designated GAM RNA, and which when bound by GAM1452 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1452 target proteins.

[20206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1452 gene, herein designated GAM GENE, on one or more GAM1452 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20207] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1452 correlate with, and may be deduced from, the identity of the target genes which GAM1452 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20208] Nucleotide sequences of the GAM1452 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1452 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1452 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1452 are further described hereinbelow with reference to Table 1.

[20209] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1452 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20210] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1453 (GAM1453) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20211] GAM1453 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1453 was detected is described hereinabove with reference to Figs. 2-8.

[20212] GAM1453 gene, herein designated GAM GENE, and GAM1453 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20213] GAM1453 gene, herein designated GAM GENE, encodes a GAM1453 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1453 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1453 precursor RNA is designated SEQ ID:1430, and is provided hereinbelow with reference to the sequence listing part.

[20214] GAM1453 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20215] An enzyme complex designated DICER COMPLEX, dices the GAM1453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1453 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1453 RNA is designated SEQ ID:4035, and is provided hereinbelow with reference to the sequence listing part.

[20216] GAM1453 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1453 target RNA, herein designated GAM TARGET RNA. GAM1453 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20217] GAM1453 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1453 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1453 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1453 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1453 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20218] The complementary binding of GAM1453 RNA, herein designated GAM RNA, to target binding sites on GAM1453 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1453 target RNA, herein designated GAM TARGET RNA, into GAM1453 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20219] It is appreciated that GAM1453 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1453 target genes. The

mRNA of each one of this plurality of GAM1453 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1453 RNA, herein designated GAM RNA, and which when bound by GAM1453 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1453 target proteins.

[20220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1453 gene, herein designated GAM GENE, on one or more GAM1453 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20221] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1453 correlate with, and may be deduced from, the identity of the target genes which GAM1453 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20222] Nucleotide sequences of the GAM1453 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1453 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1453 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1453 are further described hereinbelow with reference to Table 1.

[20223] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1453 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20224] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1454 (GAM1454) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20225] GAM1454 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1454 was detected is described hereinabove with reference to Figs. 2-8.

[20226] GAM1454 gene, herein designated GAM GENE, and GAM1454 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20227] GAM1454 gene, herein designated GAM GENE, encodes a GAM1454 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1454 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1454 precursor RNA is designated SEQ ID:1431, and is provided hereinbelow with reference to the sequence listing part.

[20228] GAM1454 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20229] An enzyme complex designated DICER COMPLEX, dices the GAM1454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1454 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1454 RNA is designated SEQ ID:4036, and is provided hereinbelow with reference to the sequence listing part.

[20230] GAM1454 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1454 target RNA, herein designated GAM TARGET RNA. GAM1454 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20231] GAM1454 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1454 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1454 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1454 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1454 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20232] The complementary binding of GAM1454 RNA, herein designated GAM RNA, to target binding sites on GAM1454 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1454 target RNA, herein designated GAM TARGET RNA, into GAM1454 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20233] It is appreciated that GAM1454 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1454 target genes. The mRNA of each one of this plurality of GAM1454 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1454 RNA, herein designated GAM RNA, and which when bound by GAM1454 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1454 target proteins.

[20234] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1454 gene, herein designated GAM GENE, on one or more GAM1454 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20235] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1454 correlate with, and may be deduced from, the identity of the target

genes which GAM1454 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20236] Nucleotide sequences of the GAM1454 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1454 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1454 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1454 are further described hereinbelow with reference to Table 1.

[20237] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1454 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20238] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1455 (GAM1455) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20239] GAM1455 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1455 was detected is described hereinabove with reference to Figs. 2-8.

[20240] GAM1455 gene, herein designated GAM GENE, and GAM1455 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20241] GAM1455 gene, herein designated GAM GENE, encodes a GAM1455 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1455 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1455 precursor RNA is designated SEQ ID:1432, and is provided hereinbelow with reference to the sequence listing part.

[20242] GAM1455 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20243] An enzyme complex designated DICER COMPLEX, dices the GAM1455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1455 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1455 RNA is designated SEQ ID:4037, and is provided

hereinbelow with reference to the sequence listing part.

[20244] GAM1455 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1455 target RNA, herein designated GAM TARGET RNA. GAM1455 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20245] GAM1455 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1455 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1455 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1455 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1455 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20246] The complementary binding of GAM1455 RNA, herein designated GAM RNA, to target binding sites on GAM1455 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1455 target RNA, herein designated GAM TARGET RNA, into GAM1455 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20247] It is appreciated that GAM1455 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1455 target genes. The mRNA of each one of this plurality of GAM1455 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1455 RNA, herein designated GAM RNA, and which when bound by GAM1455 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1455 target proteins.

[20248] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1455 gene, herein designated GAM GENE, on one or more GAM1455 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20249] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1455 correlate with, and may be deduced from, the identity of the target genes which GAM1455 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20250] Nucleotide sequences of the GAM1455 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1455 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1455 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1455 are further described hereinbelow with reference to Table 1.

[20251] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1455 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20252] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1456 (GAM1456) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20253] GAM1456 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1456 was detected is described hereinabove with reference to Figs. 2-8.

[20254] GAM1456 gene, herein designated GAM GENE, and GAM1456 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20255] GAM1456 gene, herein designated GAM GENE, encodes a GAM1456 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1456 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1456 precursor RNA is designated SEQ ID:1433, and is provided hereinbelow with reference to the sequence listing part.

[20256] GAM1456 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20257] An enzyme complex designated DICER COMPLEX, dices the GAM1456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1456 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1456 RNA is designated SEQ ID:4038, and is provided hereinbelow with reference to the sequence listing part.

[20258] GAM1456 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1456 target RNA, herein designated GAM TARGET RNA. GAM1456 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20259] GAM1456 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1456 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1456 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1456 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1456 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20260] The complementary binding of GAM1456 RNA, herein designated GAM RNA, to target binding sites on GAM1456 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1456 target RNA, herein designated GAM TARGET RNA, into GAM1456 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20261] It is appreciated that GAM1456 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1456 target genes. The mRNA of each one of this plurality of GAM1456 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1456 RNA, herein designated GAM RNA, and which when bound by GAM1456 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1456 target proteins.

[20262] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1456 gene, herein designated GAM GENE, on one or more GAM1456 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20263] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1456 correlate with, and may be deduced from, the identity of the target genes which GAM1456 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20264] Nucleotide sequences of the GAM1456 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1456 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1456 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1456 are further described hereinbelow with reference to Table 1.

[20265] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1456 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20266] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1457 (GAM1457) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20267] GAM1457 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1457 was detected is described hereinabove with reference to Figs. 2-8.

[20268] GAM1457 gene, herein designated GAM GENE, and GAM1457 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20269] GAM1457 gene, herein designated GAM GENE, encodes a GAM1457 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1457 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1457 precursor RNA is designated SEQ ID:1434, and is provided hereinbelow with reference to the sequence listing part.

[20270] GAM1457 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20271] An enzyme complex designated DICER COMPLEX, dices the GAM1457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1457 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1457 RNA is designated SEQ ID:4040, and is provided hereinbelow with reference to the sequence listing part.

[20272] GAM1457 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1457 target RNA, herein designated GAM TARGET RNA. GAM1457 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20273] GAM1457 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1457 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1457 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1457 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1457 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20274] The complementary binding of GAM1457 RNA, herein designated GAM RNA, to target binding sites on GAM1457 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1457 target RNA, herein designated GAM TARGET RNA, into GAM1457 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20275] It is appreciated that GAM1457 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1457 target genes. The mRNA of each one of this plurality of GAM1457 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1457 RNA, herein designated GAM RNA, and which when bound by GAM1457 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1457 target proteins.

[20276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1457 gene, herein designated GAM GENE, on one or more GAM1457 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20277] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1457 correlate with, and may be deduced from, the identity of the target genes which GAM1457 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20278] Nucleotide sequences of the GAM1457 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1457 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1457 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1457 are further described hereinbelow with reference to Table 1.

[20279] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1457 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20280] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1458 (GAM1458) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20281] GAM1458 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1458 was detected is described hereinabove with reference to Figs. 2-8.

[20282] GAM1458 gene, herein designated GAM GENE, and GAM1458 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20283] GAM1458 gene, herein designated GAM GENE, encodes a GAM1458 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1458 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1458 precursor RNA is designated SEQ ID:1435, and is provided hereinbelow with reference to the sequence listing part.

[20284] GAM1458 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20285] An enzyme complex designated DICER COMPLEX, dices the GAM1458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1458 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1458 RNA is designated SEQ ID:4039, and is provided hereinbelow with reference to the sequence listing part.

[20286] GAM1458 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1458 target RNA, herein designated GAM TARGET RNA. GAM1458 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20287] GAM1458 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1458 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1458 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1458 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1458 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20288] The complementary binding of GAM1458 RNA, herein designated GAM RNA, to target binding sites on GAM1458 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1458 target RNA, herein designated GAM TARGET RNA, into GAM1458 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20289] It is appreciated that GAM1458 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1458 target genes. The mRNA of each one of this plurality of GAM1458 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1458 RNA, herein designated GAM RNA, and which when bound by GAM1458 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1458 target proteins.

[20290] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1458 gene, herein designated GAM GENE, on one or more GAM1458 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20291] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1458 correlate with, and may be deduced from, the identity of the target genes which GAM1458 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20292] Nucleotide sequences of the GAM1458 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1458 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1458 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1458 are further described hereinbelow with reference to Table 1.

[20293] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1458 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20294] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1459 (GAM1459) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20295] GAM1459 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1459 was detected is described hereinabove with reference to Figs. 2-8.

[20296] GAM1459 gene, herein designated GAM GENE, and GAM1459 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20297] GAM1459 gene, herein designated GAM GENE, encodes a GAM1459 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1459 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1459 precursor RNA is designated SEQ ID:1436, and is provided hereinbelow with reference to the sequence listing part.

[20298] GAM1459 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20299] An enzyme complex designated DICER COMPLEX, dices the GAM1459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1459 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM1459 RNA is designated SEQ ID:4041, and is provided hereinbelow with reference to the sequence listing part.

[20300] GAM1459 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1459 target RNA, herein designated GAM TARGET RNA. GAM1459 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20301] GAM1459 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1459 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1459 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1459 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1459 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20302] The complementary binding of GAM1459 RNA, herein designated GAM RNA, to target binding sites on GAM1459 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1459 target RNA, herein designated GAM TARGET RNA, into GAM1459 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20303] It is appreciated that GAM1459 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1459 target genes. The

mRNA of each one of this plurality of GAM1459 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1459 RNA, herein designated GAM RNA, and which when bound by GAM1459 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1459 target proteins.

[20304] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1459 gene, herein designated GAM GENE, on one or more GAM1459 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20305] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1459 correlate with, and may be deduced from, the identity of the target genes which GAM1459 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20306] Nucleotide sequences of the GAM1459 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1459 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1459 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1459 are further described hereinbelow with reference to Table 1.

[20307] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1459 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20308] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1460 (GAM1460) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20309] GAM1460 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1460 was detected is described hereinabove with reference to Figs. 2-8.

[20310] GAM1460 gene, herein designated GAM GENE, and GAM1460 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20311] GAM1460 gene, herein designated GAM GENE, encodes a GAM1460 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1460 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1460 precursor RNA is designated SEQ ID:1437, and is provided hereinbelow with reference to the sequence listing part.

[20312] GAM1460 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20313] An enzyme complex designated DICER COMPLEX, dices the GAM1460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1460 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1460 RNA is designated SEQ ID:4042, and is provided hereinbelow with reference to the sequence listing part.

[20314] GAM1460 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1460 target RNA, herein designated GAM TARGET RNA. GAM1460 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20315] GAM1460 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1460 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1460 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1460 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1460 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20316] The complementary binding of GAM1460 RNA, herein designated GAM RNA, to target binding sites on GAM1460 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1460 target RNA, herein designated GAM TARGET RNA, into GAM1460 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20317] It is appreciated that GAM1460 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1460 target genes. The mRNA of each one of this plurality of GAM1460 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1460 RNA, herein designated GAM RNA, and which when bound by GAM1460 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1460 target proteins.

[20318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1460 gene, herein designated GAM GENE, on one or more GAM1460 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20319] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1460 correlate with, and may be deduced from, the identity of the target

genes which GAM1460 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20320] Nucleotide sequences of the GAM1460 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1460 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1460 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1460 are further described hereinbelow with reference to Table 1.

[20321] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1460 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20322] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1461 (GAM1461) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20323] GAM1461 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1461 was detected is described hereinabove with reference to Figs. 2-8.

[20324] GAM1461 gene, herein designated GAM GENE, and GAM1461 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20325] GAM1461 gene, herein designated GAM GENE, encodes a GAM1461 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1461 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1461 precursor RNA is designated SEQ ID:1438, and is provided hereinbelow with reference to the sequence listing part.

[20326] GAM1461 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20327] An enzyme complex designated DICER COMPLEX, dices the GAM1461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1461 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1461 RNA is designated SEQ ID:4043, and is provided

hereinbelow with reference to the sequence listing part.

[20328] GAM1461 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1461 target RNA, herein designated GAM TARGET RNA. GAM1461 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20329] GAM1461 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1461 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1461 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1461 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1461 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20330] The complementary binding of GAM1461 RNA, herein designated GAM RNA, to target binding sites on GAM1461 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1461 target RNA, herein designated GAM TARGET RNA, into GAM1461 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20331] It is appreciated that GAM1461 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1461 target genes. The mRNA of each one of this plurality of GAM1461 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1461 RNA, herein designated GAM RNA, and which when bound by GAM1461 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1461 target proteins.

[20332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1461 gene, herein designated GAM GENE, on one or more GAM1461 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20333] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1461 correlate with, and may be deduced from, the identity of the target genes which GAM1461 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20334] Nucleotide sequences of the GAM1461 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1461 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1461 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1461 are further described hereinbelow with reference to Table 1.

[20335] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1461 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20336] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1462 (GAM1462) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20337] GAM1462 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1462 was detected is described hereinabove with reference to Figs. 2-8.

[20338] GAM1462 gene, herein designated GAM GENE, and GAM1462 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20339] GAM1462 gene, herein designated GAM GENE, encodes a GAM1462 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1462 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1462 precursor RNA is designated SEQ ID:1439, and is provided hereinbelow with reference to the sequence listing part.

[20340] GAM1462 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20341] An enzyme complex designated DICER COMPLEX, dices the GAM1462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1462 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM1462 RNA is designated SEQ ID:4044, and is provided hereinbelow with reference to the sequence listing part.

[20342] GAM1462 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1462 target RNA, herein designated GAM TARGET RNA. GAM1462 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20343] GAM1462 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1462 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1462 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1462 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1462 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20344] The complementary binding of GAM1462 RNA, herein designated GAM RNA, to target binding sites on GAM1462 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1462 target RNA, herein designated GAM TARGET RNA, into GAM1462 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20345] It is appreciated that GAM1462 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1462 target genes. The mRNA of each one of this plurality of GAM1462 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1462 RNA, herein designated GAM RNA, and which when bound by GAM1462 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1462 target proteins.

[20346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1462 gene, herein designated GAM GENE, on one or more GAM1462 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20347] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1462 correlate with, and may be deduced from, the identity of the target genes which GAM1462 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20348] Nucleotide sequences of the GAM1462 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1462 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1462 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1462 are further described hereinbelow with reference to Table 1.

[20349] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1462 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20350] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1463 (GAM1463) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20351] GAM1463 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1463 was detected is described hereinabove with reference to Figs. 2-8.

[20352] GAM1463 gene, herein designated GAM GENE, and GAM1463 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20353] GAM1463 gene, herein designated GAM GENE, encodes a GAM1463 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1463 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1463 precursor RNA is designated SEQ ID:1440, and is provided hereinbelow with reference to the sequence listing part.

[20354] GAM1463 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20355] An enzyme complex designated DICER COMPLEX, dices the GAM1463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1463 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1463 RNA is designated SEQ ID:4045, and is provided hereinbelow with reference to the sequence listing part.

[20356] GAM1463 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1463 target RNA, herein designated GAM TARGET RNA. GAM1463 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20357] GAM1463 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1463 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1463 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1463 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1463 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20358] The complementary binding of GAM1463 RNA, herein designated GAM RNA, to target binding sites on GAM1463 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1463 target RNA, herein designated GAM TARGET RNA, into GAM1463 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20359] It is appreciated that GAM1463 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1463 target genes. The mRNA of each one of this plurality of GAM1463 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1463 RNA, herein designated GAM RNA, and which when bound by GAM1463 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1463 target proteins.

[20360] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1463 gene, herein designated GAM GENE, on one or more GAM1463 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20361] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1463 correlate with, and may be deduced from, the identity of the target genes which GAM1463 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20362] Nucleotide sequences of the GAM1463 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1463 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1463 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1463 are further described hereinbelow with reference to Table 1.

[20363] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1463 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20364] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1464 (GAM1464) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20365] GAM1464 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1464 was detected is described hereinabove with reference to Figs. 2-8.

[20366] GAM1464 gene, herein designated GAM GENE, and GAM1464 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20367] GAM1464 gene, herein designated GAM GENE, encodes a GAM1464 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1464 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1464 precursor RNA is designated SEQ ID:1441, and is provided hereinbelow with reference to the sequence listing part.

[20368] GAM1464 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20369] An enzyme complex designated DICER COMPLEX, dices the GAM1464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1464 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1464 RNA is designated SEQ ID:4046, and is provided hereinbelow with reference to the sequence listing part.

[20370] GAM1464 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1464 target RNA, herein designated GAM TARGET RNA. GAM1464 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20371] GAM1464 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1464 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1464 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1464 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1464 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20372] The complementary binding of GAM1464 RNA, herein designated GAM RNA, to target binding sites on GAM1464 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1464 target RNA, herein designated GAM TARGET RNA, into GAM1464 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20373] It is appreciated that GAM1464 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1464 target genes. The mRNA of each one of this plurality of GAM1464 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1464 RNA, herein designated GAM RNA, and which when bound by GAM1464 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1464 target proteins.

[20374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1464 gene, herein designated GAM GENE, on one or more GAM1464 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20375] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1464 correlate with, and may be deduced from, the identity of the target genes which GAM1464 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20376] Nucleotide sequences of the GAM1464 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1464 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1464 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1464 are further described hereinbelow with reference to Table 1.

[20377] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1464 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20378] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1465 (GAM1465) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20379] GAM1465 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1465 was detected is described hereinabove with reference to Figs. 2-8.

[20380] GAM1465 gene, herein designated GAM GENE, and GAM1465 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20381] GAM1465 gene, herein designated GAM GENE, encodes a GAM1465 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1465 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1465 precursor RNA is designated SEQ ID:1442, and is provided hereinbelow with reference to the sequence listing part.

[20382] GAM1465 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20383] An enzyme complex designated DICER COMPLEX, dices the GAM1465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1465 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1465 RNA is designated SEQ ID:4047, and is provided hereinbelow with reference to the sequence listing part.

[20384] GAM1465 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1465 target RNA, herein designated GAM TARGET RNA. GAM1465 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20385] GAM1465 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1465 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1465 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1465 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1465 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20386] The complementary binding of GAM1465 RNA, herein designated GAM RNA, to target binding sites on GAM1465 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1465 target RNA, herein designated GAM TARGET RNA, into GAM1465 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20387] It is appreciated that GAM1465 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1465 target genes. The

mRNA of each one of this plurality of GAM1465 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1465 RNA, herein designated GAM RNA, and which when bound by GAM1465 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1465 target proteins.

[20388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1465 gene, herein designated GAM GENE, on one or more GAM1465 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20389] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1465 correlate with, and may be deduced from, the identity of the target genes which GAM1465 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20390] Nucleotide sequences of the GAM1465 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1465 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1465 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1465 are further described hereinbelow with reference to Table 1.

[20391] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1465 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20392] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1466 (GAM1466) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20393] GAM1466 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1466 was detected is described hereinabove with reference to Figs. 2-8.

[20394] GAM1466 gene, herein designated GAM GENE, and GAM1466 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20395] GAM1466 gene, herein designated GAM GENE, encodes a GAM1466 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1466 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1466 precursor RNA is designated SEQ ID:1443, and is provided hereinbelow with reference to the sequence listing part.

[20396] GAM1466 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20397] An enzyme complex designated DICER COMPLEX, dices the GAM1466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1466 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1466 RNA is designated SEQ ID:4048, and is provided hereinbelow with reference to the sequence listing part.

[20398] GAM1466 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1466 target RNA, herein designated GAM TARGET RNA. GAM1466 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20399] GAM1466 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1466 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1466 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1466 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1466 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20400] The complementary binding of GAM1466 RNA, herein designated GAM RNA, to target binding sites on GAM1466 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1466 target RNA, herein designated GAM TARGET RNA, into GAM1466 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20401] It is appreciated that GAM1466 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1466 target genes. The mRNA of each one of this plurality of GAM1466 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1466 RNA, herein designated GAM RNA, and which when bound by GAM1466 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1466 target proteins.

[20402] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1466 gene, herein designated GAM GENE, on one or more GAM1466 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20403] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1466 correlate with, and may be deduced from, the identity of the target

genes which GAM1466 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20404] Nucleotide sequences of the GAM1466 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1466 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1466 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1466 are further described hereinbelow with reference to Table 1.

[20405] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1466 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20406] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1467 (GAM1467) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20407] GAM1467 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1467 was detected is described hereinabove with reference to Figs. 2-8.

[20408] GAM1467 gene, herein designated GAM GENE, and GAM1467 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20409] GAM1467 gene, herein designated GAM GENE, encodes a GAM1467 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1467 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1467 precursor RNA is designated SEQ ID:1444, and is provided hereinbelow with reference to the sequence listing part.

[20410] GAM1467 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20411] An enzyme complex designated DICER COMPLEX, dices the GAM1467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1467 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1467 RNA is designated SEQ ID:4049, and is provided hereinbelow with reference to the sequence listing part.

[20412] GAM1467 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1467 target RNA, herein designated GAM TARGET RNA. GAM1467 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20413] GAM1467 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1467 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1467 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1467 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1467 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20414] The complementary binding of GAM1467 RNA, herein designated GAM RNA, to target binding sites on GAM1467 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1467 target RNA, herein designated GAM TARGET RNA, into GAM1467 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20415] It is appreciated that GAM1467 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1467 target genes. The mRNA of each one of this plurality of GAM1467 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1467 RNA, herein designated GAM RNA, and which when bound by GAM1467 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1467 target proteins.

[20416] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1467 gene, herein designated GAM GENE, on one or more GAM1467 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20417] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1467 correlate with, and may be deduced from, the identity of the target genes which GAM1467 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20418] Nucleotide sequences of the GAM1467 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1467 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1467 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1467 are further described hereinbelow with reference to Table 1.

[20419] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM1467 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20420] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1468 (GAM1468) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20421] GAM1468 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1468 was detected is described hereinabove with reference to Figs. 2-8.

[20422] GAM1468 gene, herein designated GAM GENE, and GAM1468 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20423] GAM1468 gene, herein designated GAM GENE, encodes a GAM1468 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1468 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1468 precursor RNA is designated SEQ ID:1445, and is provided hereinbelow with reference to the sequence listing part.

[20424] GAM1468 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1468 folded precursor RNA, herein designated

GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20425] An enzyme complex designated DICER COMPLEX, dices the GAM1468 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1468 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1468 RNA is designated SEQ ID:4050, and is provided hereinbelow with reference to the sequence listing part.

[20426] GAM1468 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1468 target RNA, herein designated GAM TARGET RNA. GAM1468 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20427] GAM1468 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1468

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1468 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1468 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1468 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20428] The complementary binding of GAM1468 RNA, herein designated GAM RNA, to target binding sites on GAM1468 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1468 target RNA, herein designated GAM TARGET RNA, into GAM1468 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20429] It is appreciated that GAM1468 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1468 target genes. The mRNA of each one of this plurality of GAM1468 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at

least partly complementary to GAM1468 RNA, herein designated GAM RNA, and which when bound by GAM1468 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1468 target proteins.

[20430] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1468 gene, herein designated GAM GENE, on one or more GAM1468 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20431] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1468 correlate with, and may be deduced from, the identity of the target genes which GAM1468 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20432] Nucleotide sequences of the GAM1468 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1468 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1468 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, of GAM1468 are further described hereinbelow with reference to Table 1.

[20433] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1468 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20434] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1469 (GAM1469) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20435] GAM1469 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1469 was detected is described hereinabove with reference to Figs. 2-8.

[20436] GAM1469 gene, herein designated GAM GENE, and GAM1469 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20437] GAM1469 gene, herein designated GAM GENE, encodes a GAM1469 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1469 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of

GAM1469 precursor RNA is designated SEQ ID:1446, and is provided hereinbelow with reference to the sequence listing part.

[20438] GAM1469 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20439] An enzyme complex designated DICER COMPLEX, dices the GAM1469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1469 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1469 RNA is designated SEQ ID:4051, and is provided hereinbelow with reference to the sequence listing part.

[20440] GAM1469 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1469 target RNA, herein designated GAM TARGET RNA. GAM1469 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3

untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20441] GAM1469 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1469 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1469 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1469 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1469 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20442] The complementary binding of GAM1469 RNA, herein designated GAM RNA, to target binding sites on GAM1469 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1469 target RNA, herein designated GAM TARGET RNA, into GAM1469 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20443] It is appreciated that GAM1469 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1469 target genes. The mRNA of each one of this plurality of GAM1469 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1469 RNA, herein designated GAM RNA, and which when bound by GAM1469 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1469 target proteins.

[20444] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1469 gene, herein designated GAM GENE, on one or more GAM1469 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20445] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1469 correlate with, and may be deduced from, the identity of the target genes which GAM1469 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20446] Nucleotide sequences of the GAM1469 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1469 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1469 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1469 are further described hereinbelow with reference to Table 1.

[20447] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1469 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20448] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1470 (GAM1470) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20449] GAM1470 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1470 was detected is described hereinabove with reference to Figs. 2-8.

[20450] GAM1470 gene, herein designated GAM GENE, and GAM1470 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20451] GAM1470 gene, herein designated GAM GENE, encodes a GAM1470

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1470 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1470 precursor RNA is designated SEQ ID:1447, and is provided hereinbelow with reference to the sequence listing part.

[20452] GAM1470 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20453] An enzyme complex designated DICER COMPLEX, dices the GAM1470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1470 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1470 RNA is designated SEQ ID:4052, and is provided hereinbelow with reference to the sequence listing part.

[20454] GAM1470 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM1470 target RNA, herein designated GAM TARGET RNA. GAM1470 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20455] GAM1470 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1470 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1470 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1470 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1470 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20456] The complementary binding of GAM1470 RNA, herein designated GAM RNA, to target binding sites on GAM1470 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of GAM1470 target RNA, herein designated GAM TARGET RNA, into GAM1470 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20457] It is appreciated that GAM1470 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1470 target genes. The mRNA of each one of this plurality of GAM1470 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1470 RNA, herein designated GAM RNA, and which when bound by GAM1470 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1470 target proteins.

[20458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1470 gene, herein designated GAM GENE, on one or more GAM1470 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20459] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1470 correlate with, and may be deduced from, the identity of the target genes which GAM1470 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20460] Nucleotide sequences of the GAM1470 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1470 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1470 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1470 are further described hereinbelow with reference to Table 1.

[20461] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1470 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20462] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1471 (GAM1471) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20463] GAM1471 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1471 was detected is described hereinabove with reference to Figs. 2-8.

[20464] GAM1471 gene, herein designated GAM GENE, and GAM1471 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20465] GAM1471 gene, herein designated GAM GENE, encodes a GAM1471 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1471 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1471 precursor RNA is designated SEQ ID:1448, and is provided hereinbelow with reference to the sequence listing part.

[20466] GAM1471 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20467] An enzyme complex designated DICER COMPLEX, dices the GAM1471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1471 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1471 RNA is designated SEQ ID:4053, and is provided hereinbelow with reference to the sequence listing part.

[20468] GAM1471 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1471 target RNA, herein designated GAM TARGET RNA. GAM1471 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20469] GAM1471 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1471 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1471 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1471 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1471 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[20470] The complementary binding of GAM1471 RNA, herein designated GAM RNA, to target binding sites on GAM1471 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1471 target RNA, herein designated GAM TARGET RNA, into GAM1471 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20471] It is appreciated that GAM1471 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1471 target genes. The mRNA of each one of this plurality of GAM1471 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1471 RNA, herein designated GAM RNA, and which when bound by GAM1471 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1471 target proteins.

[20472] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1471 gene, herein designated GAM GENE, on one or more GAM1471 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20473] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1471 correlate with, and may be deduced from, the identity of the target genes which GAM1471 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20474] Nucleotide sequences of the GAM1471 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1471 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1471 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1471 are further described hereinbelow with reference to Table 1.

[20475] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1471 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20476] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1472 (GAM1472) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20477] GAM1472 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1472 was detected is described hereinabove with reference to Figs. 2-8.

[20478] GAM1472 gene, herein designated GAM GENE, and GAM1472 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20479] GAM1472 gene, herein designated GAM GENE, encodes a GAM1472 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1472 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1472 precursor RNA is designated SEQ ID:1449, and is provided hereinbelow with reference to the sequence listing part.

[20480] GAM1472 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20481] An enzyme complex designated DICER COMPLEX, dices the GAM1472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1472 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1472 RNA is designated SEQ ID:4055, and is provided hereinbelow with reference to the sequence listing part.

[20482] GAM1472 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1472 target RNA, herein designated GAM TARGET RNA. GAM1472 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20483] GAM1472 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1472 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1472 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1472 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1472 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20484] The complementary binding of GAM1472 RNA, herein designated GAM RNA, to target binding sites on GAM1472 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1472 target RNA, herein designated GAM TARGET RNA, into GAM1472 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20485] It is appreciated that GAM1472 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1472 target genes. The mRNA of each one of this plurality of GAM1472 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1472 RNA, herein designated GAM RNA, and which when bound by GAM1472 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1472 target proteins.

[20486] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1472 gene, herein designated GAM GENE, on one or more GAM1472 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20487] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1472 correlate with, and may be deduced from, the identity of the target genes which GAM1472 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20488] Nucleotide sequences of the GAM1472 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1472 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1472 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1472 are further described hereinbelow with reference to Table 1.

[20489] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1472 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20490] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as

Genomic Address Messenger 1473 (GAM1473) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20491] GAM1473 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1473 was detected is described hereinabove with reference to Figs. 2-8.

[20492] GAM1473 gene, herein designated GAM GENE, and GAM1473 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20493] GAM1473 gene, herein designated GAM GENE, encodes a GAM1473 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1473 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1473 precursor RNA is designated SEQ ID:1450, and is provided hereinbelow with reference to the sequence listing part.

[20494] GAM1473 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20495] An enzyme complex designated DICER COMPLEX, dices the GAM1473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1473 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1473 RNA is designated SEQ ID:4054, and is provided hereinbelow with reference to the sequence listing part.

[20496] GAM1473 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1473 target RNA, herein designated GAM TARGET RNA. GAM1473 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20497] GAM1473 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1473 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1473 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1473 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1473 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20498] The complementary binding of GAM1473 RNA, herein designated GAM RNA, to target binding sites on GAM1473 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1473 target RNA, herein designated GAM TARGET RNA, into GAM1473 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20499] It is appreciated that GAM1473 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1473 target genes. The mRNA of each one of this plurality of GAM1473 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1473 RNA, herein designated GAM RNA, and which when bound by GAM1473 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1473 target proteins.

[20500] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1473 gene, herein designated GAM GENE, on one or more GAM1473 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20501] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1473 correlate with, and may be deduced from, the identity of the target genes which GAM1473 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20502] Nucleotide sequences of the GAM1473 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1473 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1473 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1473 are further described hereinbelow with reference to Table 1.

[20503] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1473 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20504] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1474 (GAM1474) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20505] GAM1474 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1474 was detected is described hereinabove with reference to Figs. 2-8.

[20506] GAM1474 gene, herein designated GAM GENE, and GAM1474 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20507] GAM1474 gene, herein designated GAM GENE, encodes a GAM1474 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1474 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1474 precursor RNA is designated SEQ ID:1451, and is provided hereinbelow with reference to the sequence listing part.

[20508] GAM1474 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20509] An enzyme complex designated DICER COMPLEX, dices the GAM1474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1474 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1474 RNA is designated SEQ ID:4056, and is provided hereinbelow with reference to the sequence listing part.

[20510] GAM1474 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1474 target RNA, herein designated GAM TARGET RNA. GAM1474 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20511] GAM1474 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1474 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1474 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1474 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1474 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20512] The complementary binding of GAM1474 RNA, herein designated GAM RNA, to target binding sites on GAM1474 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1474 target RNA, herein designated GAM TARGET RNA, into GAM1474 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20513] It is appreciated that GAM1474 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1474 target genes. The mRNA of each one of this plurality of GAM1474 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1474 RNA, herein designated GAM RNA, and which when bound by GAM1474 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1474 target proteins.

[20514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1474 gene, herein designated GAM GENE, on one or more GAM1474 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20515] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1474 correlate with, and may be deduced from, the identity of the target genes which GAM1474 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20516] Nucleotide sequences of the GAM1474 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1474 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1474 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1474 are further described hereinbelow with reference to Table 1.

[20517] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1474 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20518] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1475 (GAM1475) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20519] GAM1475 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1475 was detected is described hereinabove with reference to Figs. 2-8.

[20520] GAM1475 gene, herein designated GAM GENE, and GAM1475 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20521] GAM1475 gene, herein designated GAM GENE, encodes a GAM1475 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1475 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1475 precursor RNA is designated SEQ ID:1452, and is provided hereinbelow with reference to the sequence listing part.

[20522] GAM1475 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20523] An enzyme complex designated DICER COMPLEX, dices the GAM1475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1475 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1475 RNA is designated SEQ ID:4057, and is provided hereinbelow with reference to the sequence listing part.

[20524] GAM1475 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1475 target RNA, herein designated GAM TARGET RNA. GAM1475 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20525] GAM1475 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1475 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1475 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1475 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1475 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20526] The complementary binding of GAM1475 RNA, herein designated GAM RNA, to target binding sites on GAM1475 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1475 target RNA, herein designated GAM TARGET RNA, into GAM1475 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20527] It is appreciated that GAM1475 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1475 target genes. The

mRNA of each one of this plurality of GAM1475 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1475 RNA, herein designated GAM RNA, and which when bound by GAM1475 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1475 target proteins.

[20528] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1475 gene, herein designated GAM GENE, on one or more GAM1475 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20529] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1475 correlate with, and may be deduced from, the identity of the target genes which GAM1475 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20530] Nucleotide sequences of the GAM1475 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1475 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1475 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1475 are further described hereinbelow with reference to Table 1.

[20531] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1475 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20532] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1476 (GAM1476) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20533] GAM1476 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1476 was detected is described hereinabove with reference to Figs. 2-8.

[20534] GAM1476 gene, herein designated GAM GENE, and GAM1476 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20535] GAM1476 gene, herein designated GAM GENE, encodes a GAM1476 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1476 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1476 precursor RNA is designated SEQ ID:1453, and is provided hereinbelow with reference to the sequence listing part.

[20536] GAM1476 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20537] An enzyme complex designated DICER COMPLEX, dices the GAM1476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1476 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1476 RNA is designated SEQ ID:4058, and is provided hereinbelow with reference to the sequence listing part.

[20538] GAM1476 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1476 target RNA, herein designated GAM TARGET RNA. GAM1476 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20539] GAM1476 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1476 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1476 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1476 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1476 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20540] The complementary binding of GAM1476 RNA, herein designated GAM RNA, to target binding sites on GAM1476 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1476 target RNA, herein designated GAM TARGET RNA, into GAM1476 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20541] It is appreciated that GAM1476 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1476 target genes. The mRNA of each one of this plurality of GAM1476 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1476 RNA, herein designated GAM RNA, and which when bound by GAM1476 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1476 target proteins.

[20542] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1476 gene, herein designated GAM GENE, on one or more GAM1476 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20543] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1476 correlate with, and may be deduced from, the identity of the target

genes which GAM1476 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20544] Nucleotide sequences of the GAM1476 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1476 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1476 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1476 are further described hereinbelow with reference to Table 1.

[20545] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1476 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20546] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1477 (GAM1477) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20547] GAM1477 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1477 was detected is described hereinabove with reference to Figs. 2-8.

[20548] GAM1477 gene, herein designated GAM GENE, and GAM1477 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20549] GAM1477 gene, herein designated GAM GENE, encodes a GAM1477 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1477 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1477 precursor RNA is designated SEQ ID:1454, and is provided hereinbelow with reference to the sequence listing part.

[20550] GAM1477 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20551] An enzyme complex designated DICER COMPLEX, dices the GAM1477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1477 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1477 RNA is designated SEQ ID:4059, and is provided

hereinbelow with reference to the sequence listing part.

[20552] GAM1477 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1477 target RNA, herein designated GAM TARGET RNA. GAM1477 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20553] GAM1477 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1477 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1477 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1477 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1477 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20554] The complementary binding of GAM1477 RNA, herein designated GAM RNA, to target binding sites on GAM1477 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1477 target RNA, herein designated GAM TARGET RNA, into GAM1477 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20555] It is appreciated that GAM1477 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1477 target genes. The mRNA of each one of this plurality of GAM1477 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1477 RNA, herein designated GAM RNA, and which when bound by GAM1477 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1477 target proteins.

[20556] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1477 gene, herein designated GAM GENE, on one or more GAM1477 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20557] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1477 correlate with, and may be deduced from, the identity of the target genes which GAM1477 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20558] Nucleotide sequences of the GAM1477 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1477 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1477 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1477 are further described hereinbelow with reference to Table 1.

[20559] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1477 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20560] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1478 (GAM1478) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20561] GAM1478 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1478 was detected is described hereinabove with reference to Figs. 2-8.

[20562] GAM1478 gene, herein designated GAM GENE, and GAM1478 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20563] GAM1478 gene, herein designated GAM GENE, encodes a GAM1478 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1478 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1478 precursor RNA is designated SEQ ID:1455, and is provided hereinbelow with reference to the sequence listing part.

[20564] GAM1478 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20565] An enzyme complex designated DICER COMPLEX, dices the GAM1478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1478 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1478 RNA is designated SEQ ID:4060, and is provided hereinbelow with reference to the sequence listing part.

[20566] GAM1478 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1478 target RNA, herein designated GAM TARGET RNA. GAM1478 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20567] GAM1478 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1478 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1478 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1478 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1478 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20568] The complementary binding of GAM1478 RNA, herein designated GAM RNA, to target binding sites on GAM1478 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1478 target RNA, herein designated GAM TARGET RNA, into GAM1478 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20569] It is appreciated that GAM1478 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1478 target genes. The mRNA of each one of this plurality of GAM1478 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1478 RNA, herein designated GAM RNA, and which when bound by GAM1478 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1478 target proteins.

[20570] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1478 gene, herein designated GAM GENE, on one or more GAM1478 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20571] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1478 correlate with, and may be deduced from, the identity of the target genes which GAM1478 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20572] Nucleotide sequences of the GAM1478 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1478 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1478 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1478 are further described hereinbelow with reference to Table 1.

[20573] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1478 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20574] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1479 (GAM1479) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20575] GAM1479 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1479 was detected is described hereinabove with reference to Figs. 2-8.

[20576] GAM1479 gene, herein designated GAM GENE, and GAM1479 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20577] GAM1479 gene, herein designated GAM GENE, encodes a GAM1479 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1479 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1479 precursor RNA is designated SEQ ID:1456, and is provided hereinbelow with reference to the sequence listing part.

[20578] GAM1479 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20579] An enzyme complex designated DICER COMPLEX, dices the GAM1479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1479 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1479 RNA is designated SEQ ID:4061, and is provided hereinbelow with reference to the sequence listing part.

[20580] GAM1479 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1479 target RNA, herein designated GAM TARGET RNA. GAM1479 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20581] GAM1479 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1479 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1479 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1479 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1479 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20582] The complementary binding of GAM1479 RNA, herein designated GAM RNA, to target binding sites on GAM1479 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1479 target RNA, herein designated GAM TARGET RNA, into GAM1479 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20583] It is appreciated that GAM1479 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1479 target genes. The mRNA of each one of this plurality of GAM1479 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1479 RNA, herein designated GAM RNA, and which when bound by GAM1479 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1479 target proteins.

[20584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1479 gene, herein designated GAM GENE, on one or more GAM1479 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20585] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1479 correlate with, and may be deduced from, the identity of the target genes which GAM1479 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20586] Nucleotide sequences of the GAM1479 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1479 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1479 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1479 are further described hereinbelow with reference to Table 1.

[20587] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1479 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20588] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1480 (GAM1480) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20589] GAM1480 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1480 was detected is described hereinabove with reference to Figs. 2-8.

[20590] GAM1480 gene, herein designated GAM GENE, and GAM1480 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20591] GAM1480 gene, herein designated GAM GENE, encodes a GAM1480 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1480 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1480 precursor RNA is designated SEQ ID:1457, and is provided hereinbelow with reference to the sequence listing part.

[20592] GAM1480 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20593] An enzyme complex designated DICER COMPLEX, dices the GAM1480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1480 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM1480 RNA is designated SEQ ID:4062, and is provided hereinbelow with reference to the sequence listing part.

[20594] GAM1480 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1480 target RNA, herein designated GAM TARGET RNA. GAM1480 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20595] GAM1480 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1480 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1480 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1480 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1480 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20596] The complementary binding of GAM1480 RNA, herein designated GAM RNA, to target binding sites on GAM1480 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1480 target RNA, herein designated GAM TARGET RNA, into GAM1480 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20597] It is appreciated that GAM1480 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1480 target genes. The mRNA of each one of this plurality of GAM1480 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1480 RNA, herein designated GAM RNA, and which when bound by GAM1480 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1480 target proteins.

[20598] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1480 gene, herein designated GAM GENE, on one or more GAM1480 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20599] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1480 correlate with, and may be deduced from, the identity of the target genes which GAM1480 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20600] Nucleotide sequences of the GAM1480 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1480 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1480 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1480 are further described hereinbelow with reference to Table 1.

[20601] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1480 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20602] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1481 (GAM1481) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20603] GAM1481 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1481 was detected is described hereinabove with reference to Figs. 2-8.

[20604] GAM1481 gene, herein designated GAM GENE, and GAM1481 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20605] GAM1481 gene, herein designated GAM GENE, encodes a GAM1481 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1481 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1481 precursor RNA is designated SEQ ID:1458, and is provided hereinbelow with reference to the sequence listing part.

[20606] GAM1481 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20607] An enzyme complex designated DICER COMPLEX, dices the GAM1481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1481 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1481 RNA is designated SEQ ID:4063, and is provided hereinbelow with reference to the sequence listing part.

[20608] GAM1481 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1481 target RNA, herein designated GAM TARGET RNA. GAM1481 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20609] GAM1481 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1481 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1481 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1481 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1481 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20610] The complementary binding of GAM1481 RNA, herein designated GAM RNA, to target binding sites on GAM1481 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1481 target RNA, herein designated GAM TARGET RNA, into GAM1481 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20611] It is appreciated that GAM1481 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1481 target genes. The

mRNA of each one of this plurality of GAM1481 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1481 RNA, herein designated GAM RNA, and which when bound by GAM1481 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1481 target proteins.

[20612] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1481 gene, herein designated GAM GENE, on one or more GAM1481 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20613] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1481 correlate with, and may be deduced from, the identity of the target genes which GAM1481 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20614] Nucleotide sequences of the GAM1481 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1481 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1481 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1481 are further described hereinbelow with reference to Table 1.

[20615] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1481 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20616] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1482 (GAM1482) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20617] GAM1482 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1482 was detected is described hereinabove with reference to Figs. 2-8.

[20618] GAM1482 gene, herein designated GAM GENE, and GAM1482 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20619] GAM1482 gene, herein designated GAM GENE, encodes a GAM1482 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1482 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1482 precursor RNA is designated SEQ ID:1459, and is provided hereinbelow with reference to the sequence listing part.

[20620] GAM1482 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20621] An enzyme complex designated DICER COMPLEX, dices the GAM1482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1482 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1482 RNA is designated SEQ ID:4064, and is provided hereinbelow with reference to the sequence listing part.

[20622] GAM1482 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1482 target RNA, herein designated GAM TARGET RNA. GAM1482 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20623] GAM1482 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1482 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1482 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1482 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1482 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20624] The complementary binding of GAM1482 RNA, herein designated GAM RNA, to target binding sites on GAM1482 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1482 target RNA, herein designated GAM TARGET RNA, into GAM1482 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20625] It is appreciated that GAM1482 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1482 target genes. The mRNA of each one of this plurality of GAM1482 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1482 RNA, herein designated GAM RNA, and which when bound by GAM1482 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1482 target proteins.

[20626] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1482 gene, herein designated GAM GENE, on one or more GAM1482 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20627] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1482 correlate with, and may be deduced from, the identity of the target

genes which GAM1482 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20628] Nucleotide sequences of the GAM1482 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1482 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1482 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1482 are further described hereinbelow with reference to Table 1.

[20629] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1482 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20630] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1483 (GAM1483) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20631] GAM1483 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1483 was detected is described hereinabove with reference to Figs. 2-8.

[20632] GAM1483 gene, herein designated GAM GENE, and GAM1483 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20633] GAM1483 gene, herein designated GAM GENE, encodes a GAM1483 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1483 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1483 precursor RNA is designated SEQ ID:1460, and is provided hereinbelow with reference to the sequence listing part.

[20634] GAM1483 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20635] An enzyme complex designated DICER COMPLEX, dices the GAM1483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1483 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1483 RNA is designated SEQ ID:4066, and is provided

hereinbelow with reference to the sequence listing part.

[20636] GAM1483 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1483 target RNA, herein designated GAM TARGET RNA. GAM1483 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20637] GAM1483 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1483 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1483 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1483 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1483 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20638] The complementary binding of GAM1483 RNA, herein designated GAM RNA, to target binding sites on GAM1483 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1483 target RNA, herein designated GAM TARGET RNA, into GAM1483 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20639] It is appreciated that GAM1483 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1483 target genes. The mRNA of each one of this plurality of GAM1483 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1483 RNA, herein designated GAM RNA, and which when bound by GAM1483 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1483 target proteins.

[20640] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1483 gene, herein designated GAM GENE, on one or more GAM1483 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20641] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1483 correlate with, and may be deduced from, the identity of the target genes which GAM1483 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20642] Nucleotide sequences of the GAM1483 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1483 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1483 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1483 are further described hereinbelow with reference to Table 1.

[20643] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1483 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20644] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1484 (GAM1484) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20645] GAM1484 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1484 was detected is described hereinabove with reference to Figs. 2-8.

[20646] GAM1484 gene, herein designated GAM GENE, and GAM1484 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20647] GAM1484 gene, herein designated GAM GENE, encodes a GAM1484 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1484 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1484 precursor RNA is designated SEQ ID:1461, and is provided hereinbelow with reference to the sequence listing part.

[20648] GAM1484 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20649] An enzyme complex designated DICER COMPLEX, dices the GAM1484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1484 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1484 RNA is designated SEQ ID:4065, and is provided hereinbelow with reference to the sequence listing part.

[20650] GAM1484 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1484 target RNA, herein designated GAM TARGET RNA. GAM1484 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20651] GAM1484 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1484 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1484 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1484 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1484 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20652] The complementary binding of GAM1484 RNA, herein designated GAM RNA, to target binding sites on GAM1484 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1484 target RNA, herein designated GAM TARGET RNA, into GAM1484 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20653] It is appreciated that GAM1484 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1484 target genes. The mRNA of each one of this plurality of GAM1484 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1484 RNA, herein designated GAM RNA, and which when bound by GAM1484 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1484 target proteins.

[20654] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1484 gene, herein designated GAM GENE, on one or more GAM1484 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20655] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1484 correlate with, and may be deduced from, the identity of the target genes which GAM1484 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20656] Nucleotide sequences of the GAM1484 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1484 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1484 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1484 are further described hereinbelow with reference to Table 1.

[20657] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1484 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20658] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1485 (GAM1485) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20659] GAM1485 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1485 was detected is described hereinabove with reference to Figs. 2-8.

[20660] GAM1485 gene, herein designated GAM GENE, and GAM1485 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20661] GAM1485 gene, herein designated GAM GENE, encodes a GAM1485 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1485 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1485 precursor RNA is designated SEQ ID:1462, and is provided hereinbelow with reference to the sequence listing part.

[20662] GAM1485 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20663] An enzyme complex designated DICER COMPLEX, dices the GAM1485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1485 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1485 RNA is designated SEQ ID:4067, and is provided hereinbelow with reference to the sequence listing part.

[20664] GAM1485 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1485 target RNA, herein designated GAM TARGET RNA. GAM1485 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20665] GAM1485 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1485 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1485 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1485 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1485 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20666] The complementary binding of GAM1485 RNA, herein designated GAM RNA, to target binding sites on GAM1485 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1485 target RNA, herein designated GAM TARGET RNA, into GAM1485 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20667] It is appreciated that GAM1485 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1485 target genes. The mRNA of each one of this plurality of GAM1485 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1485 RNA, herein designated GAM RNA, and which when bound by GAM1485 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1485 target proteins.

[20668] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1485 gene, herein designated GAM GENE, on one or more GAM1485 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20669] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1485 correlate with, and may be deduced from, the identity of the target genes which GAM1485 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20670] Nucleotide sequences of the GAM1485 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1485 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1485 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1485 are further described hereinbelow with reference to Table 1.

[20671] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1485 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20672] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1486 (GAM1486) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20673] GAM1486 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1486 was detected is described hereinabove with reference to Figs. 2-8.

[20674] GAM1486 gene, herein designated GAM GENE, and GAM1486 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20675] GAM1486 gene, herein designated GAM GENE, encodes a GAM1486 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1486 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1486 precursor RNA is designated SEQ ID:1463, and is provided hereinbelow with reference to the sequence listing part.

[20676] GAM1486 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20677] An enzyme complex designated DICER COMPLEX, dices the GAM1486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1486 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1486 RNA is designated SEQ ID:4068, and is provided hereinbelow with reference to the sequence listing part.

[20678] GAM1486 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1486 target RNA, herein designated GAM TARGET RNA. GAM1486 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20679] GAM1486 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1486 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1486 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1486 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1486 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20680] The complementary binding of GAM1486 RNA, herein designated GAM RNA, to target binding sites on GAM1486 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1486 target RNA, herein designated GAM TARGET RNA, into GAM1486 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20681] It is appreciated that GAM1486 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1486 target genes. The mRNA of each one of this plurality of GAM1486 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1486 RNA, herein designated GAM RNA, and which when bound by GAM1486 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1486 target proteins.

[20682] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1486 gene, herein designated GAM GENE, on one or more GAM1486 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20683] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1486 correlate with, and may be deduced from, the identity of the target genes which GAM1486 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20684] Nucleotide sequences of the GAM1486 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1486 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1486 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1486 are further described hereinbelow with reference to Table 1.

[20685] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1486 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20686] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1487 (GAM1487) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20687] GAM1487 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1487 was detected is described hereinabove with reference to Figs. 2-8.

[20688] GAM1487 gene, herein designated GAM GENE, and GAM1487 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20689] GAM1487 gene, herein designated GAM GENE, encodes a GAM1487 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1487 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1487 precursor RNA is designated SEQ ID:1464, and is provided hereinbelow with reference to the sequence listing part.

[20690] GAM1487 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20691] An enzyme complex designated DICER COMPLEX, dices the GAM1487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1487 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1487 RNA is designated SEQ ID:4069, and is provided hereinbelow with reference to the sequence listing part.

[20692] GAM1487 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1487 target RNA, herein designated GAM TARGET RNA. GAM1487 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20693] GAM1487 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1487 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1487 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1487 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1487 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20694] The complementary binding of GAM1487 RNA, herein designated GAM RNA, to target binding sites on GAM1487 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1487 target RNA, herein designated GAM TARGET RNA, into GAM1487 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20695] It is appreciated that GAM1487 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1487 target genes. The

mRNA of each one of this plurality of GAM1487 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1487 RNA, herein designated GAM RNA, and which when bound by GAM1487 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1487 target proteins.

[20696] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1487 gene, herein designated GAM GENE, on one or more GAM1487 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20697] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1487 correlate with, and may be deduced from, the identity of the target genes which GAM1487 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20698] Nucleotide sequences of the GAM1487 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1487 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1487 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1487 are further described hereinbelow with reference to Table 1.

[20699] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1487 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20700] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1488 (GAM1488) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20701] GAM1488 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1488 was detected is described hereinabove with reference to Figs. 2-8.

[20702] GAM1488 gene, herein designated GAM GENE, and GAM1488 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20703] GAM1488 gene, herein designated GAM GENE, encodes a GAM1488 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1488 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1488 precursor RNA is designated SEQ ID:1465, and is provided hereinbelow with reference to the sequence listing part.

[20704] GAM1488 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20705] An enzyme complex designated DICER COMPLEX, dices the GAM1488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1488 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1488 RNA is designated SEQ ID:4070, and is provided hereinbelow with reference to the sequence listing part.

[20706] GAM1488 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1488 target RNA, herein designated GAM TARGET RNA. GAM1488 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20707] GAM1488 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1488 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1488 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1488 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1488 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20708] The complementary binding of GAM1488 RNA, herein designated GAM RNA, to target binding sites on GAM1488 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1488 target RNA, herein designated GAM TARGET RNA, into GAM1488 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20709] It is appreciated that GAM1488 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1488 target genes. The mRNA of each one of this plurality of GAM1488 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1488 RNA, herein designated GAM RNA, and which when bound by GAM1488 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1488 target proteins.

[20710] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1488 gene, herein designated GAM GENE, on one or more GAM1488 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20711] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1488 correlate with, and may be deduced from, the identity of the target

genes which GAM1488 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20712] Nucleotide sequences of the GAM1488 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1488 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1488 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1488 are further described hereinbelow with reference to Table 1.

[20713] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1488 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20714] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1489 (GAM1489) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20715] GAM1489 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1489 was detected is described hereinabove with reference to Figs. 2-8.

[20716] GAM1489 gene, herein designated GAM GENE, and GAM1489 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20717] GAM1489 gene, herein designated GAM GENE, encodes a GAM1489 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1489 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1489 precursor RNA is designated SEQ ID:1466, and is provided hereinbelow with reference to the sequence listing part.

[20718] GAM1489 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20719] An enzyme complex designated DICER COMPLEX, dices the GAM1489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1489 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1489 RNA is designated SEQ ID:4071, and is provided

hereinbelow with reference to the sequence listing part.

[20720] GAM1489 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1489 target RNA, herein designated GAM TARGET RNA. GAM1489 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20721] GAM1489 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1489 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1489 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1489 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1489 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20722] The complementary binding of GAM1489 RNA, herein designated GAM RNA, to target binding sites on GAM1489 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1489 target RNA, herein designated GAM TARGET RNA, into GAM1489 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20723] It is appreciated that GAM1489 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1489 target genes. The mRNA of each one of this plurality of GAM1489 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1489 RNA, herein designated GAM RNA, and which when bound by GAM1489 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1489 target proteins.

[20724] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1489 gene, herein designated GAM GENE, on one or more GAM1489 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20725] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1489 correlate with, and may be deduced from, the identity of the target genes which GAM1489 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20726] Nucleotide sequences of the GAM1489 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1489 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1489 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1489 are further described hereinbelow with reference to Table 1.

[20727] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1489 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20728] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1490 (GAM1490) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20729] GAM1490 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1490 was detected is described hereinabove with reference to Figs. 2-8.

[20730] GAM1490 gene, herein designated GAM GENE, and GAM1490 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20731] GAM1490 gene, herein designated GAM GENE, encodes a GAM1490 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1490 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1490 precursor RNA is designated SEQ ID:1467, and is provided hereinbelow with reference to the sequence listing part.

[20732] GAM1490 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20733] An enzyme complex designated DICER COMPLEX, dices the GAM1490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1490 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1490 RNA is designated SEQ ID:4072, and is provided hereinbelow with reference to the sequence listing part.

[20734] GAM1490 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1490 target RNA, herein designated GAM TARGET RNA. GAM1490 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20735] GAM1490 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1490 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1490 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1490 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1490 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20736] The complementary binding of GAM1490 RNA, herein designated GAM RNA, to target binding sites on GAM1490 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1490 target RNA, herein designated GAM TARGET RNA, into GAM1490 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20737] It is appreciated that GAM1490 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1490 target genes. The mRNA of each one of this plurality of GAM1490 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1490 RNA, herein designated GAM RNA, and which when bound by GAM1490 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1490 target proteins.

[20738] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1490 gene, herein designated GAM GENE, on one or more GAM1490 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20739] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1490 correlate with, and may be deduced from, the identity of the target genes which GAM1490 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20740] Nucleotide sequences of the GAM1490 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1490 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1490 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1490 are further described hereinbelow with reference to Table 1.

[20741] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1490 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20742] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1491 (GAM1491) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20743] GAM1491 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1491 was detected is described hereinabove with reference to Figs. 2-8.

[20744] GAM1491 gene, herein designated GAM GENE, and GAM1491 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20745] GAM1491 gene, herein designated GAM GENE, encodes a GAM1491 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1491 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1491 precursor RNA is designated SEQ ID:1468, and is provided hereinbelow with reference to the sequence listing part.

[20746] GAM1491 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20747] An enzyme complex designated DICER COMPLEX, dices the GAM1491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1491 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1491 RNA is designated SEQ ID:4073, and is provided hereinbelow with reference to the sequence listing part.

[20748] GAM1491 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1491 target RNA, herein designated GAM TARGET RNA. GAM1491 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20749] GAM1491 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1491 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1491 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1491 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1491 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20750] The complementary binding of GAM1491 RNA, herein designated GAM RNA, to target binding sites on GAM1491 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1491 target RNA, herein designated GAM TARGET RNA, into GAM1491 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20751] It is appreciated that GAM1491 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1491 target genes. The mRNA of each one of this plurality of GAM1491 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1491 RNA, herein designated GAM RNA, and which when bound by GAM1491 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1491 target proteins.

[20752] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1491 gene, herein designated GAM GENE, on one or more GAM1491 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20753] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1491 correlate with, and may be deduced from, the identity of the target genes which GAM1491 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20754] Nucleotide sequences of the GAM1491 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1491 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1491 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1491 are further described hereinbelow with reference to Table 1.

[20755] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1491 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20756] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1492 (GAM1492) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20757] GAM1492 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1492 was detected is described hereinabove with reference to Figs. 2-8.

[20758] GAM1492 gene, herein designated GAM GENE, and GAM1492 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20759] GAM1492 gene, herein designated GAM GENE, encodes a GAM1492 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1492 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1492 precursor RNA is designated SEQ ID:1469, and is provided hereinbelow with reference to the sequence listing part.

[20760] GAM1492 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20761] An enzyme complex designated DICER COMPLEX, dices the GAM1492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1492 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1492 RNA is designated SEQ ID:4074, and is provided hereinbelow with reference to the sequence listing part.

[20762] GAM1492 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1492 target RNA, herein designated GAM TARGET RNA. GAM1492 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20763] GAM1492 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1492 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1492 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1492 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1492 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20764] The complementary binding of GAM1492 RNA, herein designated GAM RNA, to target binding sites on GAM1492 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1492 target RNA, herein designated GAM TARGET RNA, into GAM1492 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20765] It is appreciated that GAM1492 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1492 target genes. The mRNA of each one of this plurality of GAM1492 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1492 RNA, herein designated GAM RNA, and which when bound by GAM1492 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1492 target proteins.

[20766] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1492 gene, herein designated GAM GENE, on one or more GAM1492 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20767] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1492 correlate with, and may be deduced from, the identity of the target genes which GAM1492 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20768] Nucleotide sequences of the GAM1492 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1492 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1492 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1492 are further described hereinbelow with reference to Table 1.

[20769] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1492 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20770] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1493 (GAM1493) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20771] GAM1493 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1493 was detected is described hereinabove with reference to Figs. 2-8.

[20772] GAM1493 gene, herein designated GAM GENE, and GAM1493 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20773] GAM1493 gene, herein designated GAM GENE, encodes a GAM1493 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1493 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1493 precursor RNA is designated SEQ ID:1470, and is provided hereinbelow with reference to the sequence listing part.

[20774] GAM1493 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20775] An enzyme complex designated DICER COMPLEX, dices the GAM1493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1493 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1493 RNA is designated SEQ ID:4075, and is provided hereinbelow with reference to the sequence listing part.

[20776] GAM1493 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1493 target RNA, herein designated GAM TARGET RNA. GAM1493 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20777] GAM1493 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1493 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1493 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1493 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1493 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20778] The complementary binding of GAM1493 RNA, herein designated GAM RNA, to target binding sites on GAM1493 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1493 target RNA, herein designated GAM TARGET RNA, into GAM1493 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20779] It is appreciated that GAM1493 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1493 target genes. The

mRNA of each one of this plurality of GAM1493 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1493 RNA, herein designated GAM RNA, and which when bound by GAM1493 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1493 target proteins.

[20780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1493 gene, herein designated GAM GENE, on one or more GAM1493 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20781] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1493 correlate with, and may be deduced from, the identity of the target genes which GAM1493 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20782] Nucleotide sequences of the GAM1493 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1493 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1493 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1493 are further described hereinbelow with reference to Table 1.

[20783] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1493 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20784] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1494 (GAM1494) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20785] GAM1494 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1494 was detected is described hereinabove with reference to Figs. 2-8.

[20786] GAM1494 gene, herein designated GAM GENE, and GAM1494 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20787] GAM1494 gene, herein designated GAM GENE, encodes a GAM1494 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1494 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1494 precursor RNA is designated SEQ ID:1471, and is provided hereinbelow with reference to the sequence listing part.

[20788] GAM1494 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20789] An enzyme complex designated DICER COMPLEX, dices the GAM1494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1494 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1494 RNA is designated SEQ ID:4076, and is provided hereinbelow with reference to the sequence listing part.

[20790] GAM1494 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1494 target RNA, herein designated GAM TARGET RNA. GAM1494 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20791] GAM1494 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1494 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1494 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1494 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1494 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20792] The complementary binding of GAM1494 RNA, herein designated GAM RNA, to target binding sites on GAM1494 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1494 target RNA, herein designated GAM TARGET RNA, into GAM1494 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20793] It is appreciated that GAM1494 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1494 target genes. The mRNA of each one of this plurality of GAM1494 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1494 RNA, herein designated GAM RNA, and which when bound by GAM1494 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1494 target proteins.

[20794] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1494 gene, herein designated GAM GENE, on one or more GAM1494 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20795] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1494 correlate with, and may be deduced from, the identity of the target

genes which GAM1494 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20796] Nucleotide sequences of the GAM1494 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1494 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1494 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1494 are further described hereinbelow with reference to Table 1.

[20797] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1494 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20798] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1495 (GAM1495) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20799] GAM1495 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1495 was detected is described hereinabove with reference to Figs. 2-8.

[20800] GAM1495 gene, herein designated GAM GENE, and GAM1495 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20801] GAM1495 gene, herein designated GAM GENE, encodes a GAM1495 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1495 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1495 precursor RNA is designated SEQ ID:1472, and is provided hereinbelow with reference to the sequence listing part.

[20802] GAM1495 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20803] An enzyme complex designated DICER COMPLEX, dices the GAM1495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1495 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1495 RNA is designated SEQ ID:4077, and is provided

hereinbelow with reference to the sequence listing part.

[20804] GAM1495 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1495 target RNA, herein designated GAM TARGET RNA. GAM1495 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20805] GAM1495 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1495 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1495 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1495 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1495 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20806] The complementary binding of GAM1495 RNA, herein designated GAM RNA, to target binding sites on GAM1495 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1495 target RNA, herein designated GAM TARGET RNA, into GAM1495 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20807] It is appreciated that GAM1495 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1495 target genes. The mRNA of each one of this plurality of GAM1495 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1495 RNA, herein designated GAM RNA, and which when bound by GAM1495 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1495 target proteins.

[20808] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1495 gene, herein designated GAM GENE, on one or more GAM1495 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20809] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1495 correlate with, and may be deduced from, the identity of the target genes which GAM1495 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20810] Nucleotide sequences of the GAM1495 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1495 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1495 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1495 are further described hereinbelow with reference to Table 1.

[20811] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1495 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20812] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1496 (GAM1496) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20813] GAM1496 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1496 was detected is described hereinabove with reference to Figs. 2-8.

[20814] GAM1496 gene, herein designated GAM GENE, and GAM1496 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20815] GAM1496 gene, herein designated GAM GENE, encodes a GAM1496 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1496 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1496 precursor RNA is designated SEQ ID:1473, and is provided hereinbelow with reference to the sequence listing part.

[20816] GAM1496 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20817] An enzyme complex designated DICER COMPLEX, dices the GAM1496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1496 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1496 RNA is designated SEQ ID:4078, and is provided hereinbelow with reference to the sequence listing part.

[20818] GAM1496 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1496 target RNA, herein designated GAM TARGET RNA. GAM1496 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20819] GAM1496 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1496 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1496 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1496 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1496 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20820] The complementary binding of GAM1496 RNA, herein designated GAM RNA, to target binding sites on GAM1496 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1496 target RNA, herein designated GAM TARGET RNA, into GAM1496 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20821] It is appreciated that GAM1496 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1496 target genes. The mRNA of each one of this plurality of GAM1496 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1496 RNA, herein designated GAM RNA, and which when bound by GAM1496 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1496 target proteins.

[20822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1496 gene, herein designated GAM GENE, on one or more GAM1496 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20823] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1496 correlate with, and may be deduced from, the identity of the target genes which GAM1496 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20824] Nucleotide sequences of the GAM1496 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1496 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1496 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1496 are further described hereinbelow with reference to Table 1.

[20825] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1496 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20826] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1497 (GAM1497) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20827] GAM1497 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1497 was detected is described hereinabove with reference to Figs. 2-8.

[20828] GAM1497 gene, herein designated GAM GENE, and GAM1497 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20829] GAM1497 gene, herein designated GAM GENE, encodes a GAM1497 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1497 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1497 precursor RNA is designated SEQ ID:1474, and is provided hereinbelow with reference to the sequence listing part.

[20830] GAM1497 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20831] An enzyme complex designated DICER COMPLEX, dices the GAM1497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1497 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM1497 RNA is designated SEQ ID:4080, and is provided hereinbelow with reference to the sequence listing part.

[20832] GAM1497 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1497 target RNA, herein designated GAM TARGET RNA. GAM1497 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20833] GAM1497 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1497 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1497 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1497 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1497 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20834] The complementary binding of GAM1497 RNA, herein designated GAM RNA, to target binding sites on GAM1497 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1497 target RNA, herein designated GAM TARGET RNA, into GAM1497 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20835] It is appreciated that GAM1497 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1497 target genes. The mRNA of each one of this plurality of GAM1497 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1497 RNA, herein designated GAM RNA, and which when bound by GAM1497 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1497 target proteins.

[20836] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1497 gene, herein designated GAM GENE, on one or more GAM1497 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20837] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1497 correlate with, and may be deduced from, the identity of the target genes which GAM1497 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20838] Nucleotide sequences of the GAM1497 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1497 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1497 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1497 are further described hereinbelow with reference to Table 1.

[20839] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1497 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20840] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1498 (GAM1498) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20841] GAM1498 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1498 was detected is described hereinabove with reference to Figs. 2-8.

[20842] GAM1498 gene, herein designated GAM GENE, and GAM1498 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20843] GAM1498 gene, herein designated GAM GENE, encodes a GAM1498 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1498 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1498 precursor RNA is designated SEQ ID:1475, and is provided hereinbelow with reference to the sequence listing part.

[20844] GAM1498 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20845] An enzyme complex designated DICER COMPLEX, dices the GAM1498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1498 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1498 RNA is designated SEQ ID:4079, and is provided hereinbelow with reference to the sequence listing part.

[20846] GAM1498 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1498 target RNA, herein designated GAM TARGET RNA. GAM1498 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20847] GAM1498 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1498 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1498 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1498 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1498 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20848] The complementary binding of GAM1498 RNA, herein designated GAM RNA, to target binding sites on GAM1498 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1498 target RNA, herein designated GAM TARGET RNA, into GAM1498 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20849] It is appreciated that GAM1498 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1498 target genes. The mRNA of each one of this plurality of GAM1498 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1498 RNA, herein designated GAM RNA, and which when bound by GAM1498 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1498 target proteins.

[20850] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1498 gene, herein designated GAM GENE, on one or more GAM1498 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20851] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1498 correlate with, and may be deduced from, the identity of the target genes which GAM1498 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20852] Nucleotide sequences of the GAM1498 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1498 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1498 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1498 are further described hereinbelow with reference to Table 1.

[20853] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1498 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20854] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1499 (GAM1499) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20855] GAM1499 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1499 was detected is described hereinabove with reference to Figs. 2-8.

[20856] GAM1499 gene, herein designated GAM GENE, and GAM1499 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20857] GAM1499 gene, herein designated GAM GENE, encodes a GAM1499 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1499 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1499 precursor RNA is designated SEQ ID:1476, and is provided hereinbelow with reference to the sequence listing part.

[20858] GAM1499 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20859] An enzyme complex designated DICER COMPLEX, dices the GAM1499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1499 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM1499 RNA is designated SEQ ID:4081, and is provided hereinbelow with reference to the sequence listing part.

[20860] GAM1499 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1499 target RNA, herein designated GAM TARGET RNA. GAM1499 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20861] GAM1499 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1499 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1499 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1499 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1499 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20862] The complementary binding of GAM1499 RNA, herein designated GAM RNA, to target binding sites on GAM1499 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1499 target RNA, herein designated GAM TARGET RNA, into GAM1499 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20863] It is appreciated that GAM1499 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1499 target genes. The

mRNA of each one of this plurality of GAM1499 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1499 RNA, herein designated GAM RNA, and which when bound by GAM1499 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1499 target proteins.

[20864] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1499 gene, herein designated GAM GENE, on one or more GAM1499 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20865] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1499 correlate with, and may be deduced from, the identity of the target genes which GAM1499 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20866] Nucleotide sequences of the GAM1499 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1499 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1499 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1499 are further described hereinbelow with reference to Table 1.

[20867] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1499 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20868] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1500 (GAM1500) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20869] GAM1500 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1500 was detected is described hereinabove with reference to Figs. 2-8.

[20870] GAM1500 gene, herein designated GAM GENE, and GAM1500 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20871] GAM1500 gene, herein designated GAM GENE, encodes a GAM1500 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1500 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1500 precursor RNA is designated SEQ ID:1477, and is provided hereinbelow with reference to the sequence listing part.

[20872] GAM1500 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20873] An enzyme complex designated DICER COMPLEX, dices the GAM1500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1500 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1500 RNA is designated SEQ ID:4082, and is provided hereinbelow with reference to the sequence listing part.

[20874] GAM1500 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1500 target RNA, herein designated GAM TARGET RNA. GAM1500 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20875] GAM1500 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1500 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1500 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1500 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1500 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20876] The complementary binding of GAM1500 RNA, herein designated GAM RNA, to target binding sites on GAM1500 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1500 target RNA, herein designated GAM TARGET RNA, into GAM1500 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20877] It is appreciated that GAM1500 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1500 target genes. The mRNA of each one of this plurality of GAM1500 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1500 RNA, herein designated GAM RNA, and which when bound by GAM1500 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1500 target proteins.

[20878] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1500 gene, herein designated GAM GENE, on one or more GAM1500 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20879] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1500 correlate with, and may be deduced from, the identity of the target

genes which GAM1500 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20880] Nucleotide sequences of the GAM1500 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1500 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1500 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1500 are further described hereinbelow with reference to Table 1.

[20881] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1500 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20882] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1501 (GAM1501) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20883] GAM1501 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1501 was detected is described hereinabove with reference to Figs. 2-8.

[20884] GAM1501 gene, herein designated GAM GENE, and GAM1501 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20885] GAM1501 gene, herein designated GAM GENE, encodes a GAM1501 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1501 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1501 precursor RNA is designated SEQ ID:1478, and is provided hereinbelow with reference to the sequence listing part.

[20886] GAM1501 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20887] An enzyme complex designated DICER COMPLEX, dices the GAM1501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1501 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1501 RNA is designated SEQ ID:4083, and is provided

hereinbelow with reference to the sequence listing part.

[20888] GAM1501 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1501 target RNA, herein designated GAM TARGET RNA. GAM1501 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20889] GAM1501 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1501 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1501 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1501 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1501 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20890] The complementary binding of GAM1501 RNA, herein designated GAM RNA, to target binding sites on GAM1501 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1501 target RNA, herein designated GAM TARGET RNA, into GAM1501 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20891] It is appreciated that GAM1501 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1501 target genes. The mRNA of each one of this plurality of GAM1501 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1501 RNA, herein designated GAM RNA, and which when bound by GAM1501 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1501 target proteins.

[20892] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1501 gene, herein designated GAM GENE, on one or more GAM1501 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20893] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1501 correlate with, and may be deduced from, the identity of the target genes which GAM1501 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20894] Nucleotide sequences of the GAM1501 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1501 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1501 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1501 are further described hereinbelow with reference to Table 1.

[20895] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1501 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20896] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1502 (GAM1502) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20897] GAM1502 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1502 was detected is described hereinabove with reference to Figs. 2-8.

[20898] GAM1502 gene, herein designated GAM GENE, and GAM1502 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20899] GAM1502 gene, herein designated GAM GENE, encodes a GAM1502 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1502 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1502 precursor RNA is designated SEQ ID:1479, and is provided hereinbelow with reference to the sequence listing part.

[20900] GAM1502 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20901] An enzyme complex designated DICER COMPLEX, dices the GAM1502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1502 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1502 RNA is designated SEQ ID:4084, and is provided hereinbelow with reference to the sequence listing part.

[20902] GAM1502 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1502 target RNA, herein designated GAM TARGET RNA. GAM1502 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20903] GAM1502 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1502 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1502 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1502 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1502 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20904] The complementary binding of GAM1502 RNA, herein designated GAM RNA, to target binding sites on GAM1502 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1502 target RNA, herein designated GAM TARGET RNA, into GAM1502 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20905] It is appreciated that GAM1502 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1502 target genes. The mRNA of each one of this plurality of GAM1502 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1502 RNA, herein designated GAM RNA, and which when bound by GAM1502 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1502 target proteins.

[20906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1502 gene, herein designated GAM GENE, on one or more GAM1502 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20907] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1502 correlate with, and may be deduced from, the identity of the target genes which GAM1502 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20908] Nucleotide sequences of the GAM1502 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1502 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1502 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1502 are further described hereinbelow with reference to Table 1.

[20909] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1502 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20910] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1503 (GAM1503) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20911] GAM1503 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1503 was detected is described hereinabove with reference to Figs. 2-8.

[20912] GAM1503 gene, herein designated GAM GENE, and GAM1503 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20913] GAM1503 gene, herein designated GAM GENE, encodes a GAM1503 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1503 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1503 precursor RNA is designated SEQ ID:1480, and is provided hereinbelow with reference to the sequence listing part.

[20914] GAM1503 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20915] An enzyme complex designated DICER COMPLEX, dices the GAM1503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1503 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM1503 RNA is designated SEQ ID:4085, and is provided hereinbelow with reference to the sequence listing part.

[20916] GAM1503 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1503 target RNA, herein designated GAM TARGET RNA. GAM1503 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20917] GAM1503 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1503 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1503 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1503 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1503 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20918] The complementary binding of GAM1503 RNA, herein designated GAM RNA, to target binding sites on GAM1503 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1503 target RNA, herein designated GAM TARGET RNA, into GAM1503 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20919] It is appreciated that GAM1503 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1503 target genes. The mRNA of each one of this plurality of GAM1503 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1503 RNA, herein designated GAM RNA, and which when bound by GAM1503 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1503 target proteins.

[20920] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1503 gene, herein designated GAM GENE, on one or more GAM1503 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20921] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1503 correlate with, and may be deduced from, the identity of the target genes which GAM1503 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20922] Nucleotide sequences of the GAM1503 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1503 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1503 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1503 are further described hereinbelow with reference to Table 1.

[20923] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1503 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[20924] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1504 (GAM1504) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20925] GAM1504 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1504 was detected is described hereinabove with reference to Figs. 2-8.

[20926] GAM1504 gene, herein designated GAM GENE, and GAM1504 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20927] GAM1504 gene, herein designated GAM GENE, encodes a GAM1504 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1504 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1504 precursor RNA is designated SEQ ID:1481, and is provided hereinbelow with reference to the sequence listing part.

[20928] GAM1504 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20929] An enzyme complex designated DICER COMPLEX, dices the GAM1504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1504 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1504 RNA is designated SEQ ID:4086, and is provided hereinbelow with reference to the sequence listing part.

[20930] GAM1504 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1504 target RNA, herein designated GAM TARGET RNA. GAM1504 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20931] GAM1504 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1504 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1504 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1504 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1504 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20932] The complementary binding of GAM1504 RNA, herein designated GAM RNA, to target binding sites on GAM1504 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1504 target RNA, herein designated GAM TARGET RNA, into GAM1504 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20933] It is appreciated that GAM1504 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1504 target genes. The mRNA of each one of this plurality of GAM1504 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1504 RNA, herein designated GAM RNA, and which when bound by GAM1504 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1504 target proteins.

[20934] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1504 gene, herein designated GAM GENE, on one or more GAM1504 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20935] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1504 correlate with, and may be deduced from, the identity of the target genes which GAM1504 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20936] Nucleotide sequences of the GAM1504 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1504 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1504 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1504 are further described hereinbelow with reference to Table 1.

[20937] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1504 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20938] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1505 (GAM1505) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20939] GAM1505 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1505 was detected is described hereinabove with reference to Figs. 2-8.

[20940] GAM1505 gene, herein designated GAM GENE, and GAM1505 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20941] GAM1505 gene, herein designated GAM GENE, encodes a GAM1505 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1505 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1505 precursor RNA is designated SEQ ID:1482, and is provided hereinbelow with reference to the sequence listing part.

[20942] GAM1505 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20943] An enzyme complex designated DICER COMPLEX, dices the GAM1505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1505 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM1505 RNA is designated SEQ ID:4087, and is provided hereinbelow with reference to the sequence listing part.

[20944] GAM1505 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1505 target RNA, herein designated GAM TARGET RNA. GAM1505 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20945] GAM1505 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1505 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1505 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1505 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1505 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20946] The complementary binding of GAM1505 RNA, herein designated GAM RNA, to target binding sites on GAM1505 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1505 target RNA, herein designated GAM TARGET RNA, into GAM1505 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20947] It is appreciated that GAM1505 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1505 target genes. The

mRNA of each one of this plurality of GAM1505 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1505 RNA, herein designated GAM RNA, and which when bound by GAM1505 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1505 target proteins.

[20948] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1505 gene, herein designated GAM GENE, on one or more GAM1505 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20949] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1505 correlate with, and may be deduced from, the identity of the target genes which GAM1505 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20950] Nucleotide sequences of the GAM1505 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1505 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1505 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1505 are further described hereinbelow with reference to Table 1.

[20951] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1505 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20952] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1506 (GAM1506) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20953] GAM1506 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1506 was detected is described hereinabove with reference to Figs. 2-8.

[20954] GAM1506 gene, herein designated GAM GENE, and GAM1506 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20955] GAM1506 gene, herein designated GAM GENE, encodes a GAM1506 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1506 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1506 precursor RNA is designated SEQ ID:1483, and is provided hereinbelow with reference to the sequence listing part.

[20956] GAM1506 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20957] An enzyme complex designated DICER COMPLEX, dices the GAM1506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1506 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1506 RNA is designated SEQ ID:4088, and is provided hereinbelow with reference to the sequence listing part.

[20958] GAM1506 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1506 target RNA, herein designated GAM TARGET RNA. GAM1506 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20959] GAM1506 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1506 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1506 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1506 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1506 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20960] The complementary binding of GAM1506 RNA, herein designated GAM RNA, to target binding sites on GAM1506 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1506 target RNA, herein designated GAM TARGET RNA, into GAM1506 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20961] It is appreciated that GAM1506 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1506 target genes. The mRNA of each one of this plurality of GAM1506 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1506 RNA, herein designated GAM RNA, and which when bound by GAM1506 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1506 target proteins.

[20962] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1506 gene, herein designated GAM GENE, on one or more GAM1506 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20963] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1506 correlate with, and may be deduced from, the identity of the target

genes which GAM1506 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20964] Nucleotide sequences of the GAM1506 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1506 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1506 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1506 are further described hereinbelow with reference to Table 1.

[20965] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1506 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20966] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1507 (GAM1507) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20967] GAM1507 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1507 was detected is described hereinabove with reference to Figs. 2-8.

[20968] GAM1507 gene, herein designated GAM GENE, and GAM1507 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[20969] GAM1507 gene, herein designated GAM GENE, encodes a GAM1507 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1507 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1507 precursor RNA is designated SEQ ID:1484, and is provided hereinbelow with reference to the sequence listing part.

[20970] GAM1507 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20971] An enzyme complex designated DICER COMPLEX, dices the GAM1507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1507 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1507 RNA is designated SEQ ID:4089, and is provided

hereinbelow with reference to the sequence listing part.

[20972] GAM1507 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1507 target RNA, herein designated GAM TARGET RNA. GAM1507 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20973] GAM1507 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1507 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1507 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1507 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1507 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20974] The complementary binding of GAM1507 RNA, herein designated GAM RNA, to target binding sites on GAM1507 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1507 target RNA, herein designated GAM TARGET RNA, into GAM1507 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20975] It is appreciated that GAM1507 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1507 target genes. The mRNA of each one of this plurality of GAM1507 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1507 RNA, herein designated GAM RNA, and which when bound by GAM1507 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1507 target proteins.

[20976] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1507 gene, herein designated GAM GENE, on one or more GAM1507 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20977] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1507 correlate with, and may be deduced from, the identity of the target genes which GAM1507 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20978] Nucleotide sequences of the GAM1507 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1507 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1507 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1507 are further described hereinbelow with reference to Table 1.

[20979] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1507 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20980] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1508 (GAM1508) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20981] GAM1508 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1508 was detected is described hereinabove with reference to Figs. 2-8.

[20982] GAM1508 gene, herein designated GAM GENE, and GAM1508 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20983] GAM1508 gene, herein designated GAM GENE, encodes a GAM1508 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1508 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1508 precursor RNA is designated SEQ ID:1485, and is provided hereinbelow with reference to the sequence listing part.

[20984] GAM1508 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20985] An enzyme complex designated DICER COMPLEX, dices the GAM1508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1508 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1508 RNA is designated SEQ ID:4090, and is provided hereinbelow with reference to the sequence listing part.

[20986] GAM1508 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1508 target RNA, herein designated GAM TARGET RNA. GAM1508 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20987] GAM1508 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1508 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1508 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1508 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1508 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20988] The complementary binding of GAM1508 RNA, herein designated GAM RNA, to target binding sites on GAM1508 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1508 target RNA, herein designated GAM TARGET RNA, into GAM1508 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[20989] It is appreciated that GAM1508 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1508 target genes. The mRNA of each one of this plurality of GAM1508 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1508 RNA, herein designated GAM RNA, and which when bound by GAM1508 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1508 target proteins.

[20990] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1508 gene, herein designated GAM GENE, on one or more GAM1508 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20991] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1508 correlate with, and may be deduced from, the identity of the target genes which GAM1508 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20992] Nucleotide sequences of the GAM1508 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1508 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1508 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1508 are further described hereinbelow with reference to Table 1.

[20993] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1508 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[20994] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1509 (GAM1509) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[20995] GAM1509 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1509 was detected is described hereinabove with reference to Figs. 2-8.

[20996] GAM1509 gene, herein designated GAM GENE, and GAM1509 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[20997] GAM1509 gene, herein designated GAM GENE, encodes a GAM1509 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1509 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1509 precursor RNA is designated SEQ ID:1486, and is provided hereinbelow with reference to the sequence listing part.

[20998] GAM1509 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20999] An enzyme complex designated DICER COMPLEX, dices the GAM1509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1509 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1509 RNA is designated SEQ ID:4091, and is provided hereinbelow with reference to the sequence listing part.

[21000] GAM1509 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1509 target RNA, herein designated GAM TARGET RNA. GAM1509 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21001] GAM1509 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1509 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1509 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1509 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1509 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21002] The complementary binding of GAM1509 RNA, herein designated GAM RNA, to target binding sites on GAM1509 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1509 target RNA, herein designated GAM TARGET RNA, into GAM1509 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21003] It is appreciated that GAM1509 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1509 target genes. The mRNA of each one of this plurality of GAM1509 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1509 RNA, herein designated GAM RNA, and which when bound by GAM1509 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1509 target proteins.

[21004] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1509 gene, herein designated GAM GENE, on one or more GAM1509 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21005] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1509 correlate with, and may be deduced from, the identity of the target genes which GAM1509 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21006] Nucleotide sequences of the GAM1509 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1509 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1509 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1509 are further described hereinbelow with reference to Table 1.

[21007] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1509 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21008] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1510 (GAM1510) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21009] GAM1510 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1510 was detected is described hereinabove with reference to Figs. 2-8.

[21010] GAM1510 gene, herein designated GAM GENE, and GAM1510 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21011] GAM1510 gene, herein designated GAM GENE, encodes a GAM1510 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1510 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1510 precursor RNA is designated SEQ ID:1487, and is provided hereinbelow with reference to the sequence listing part.

[21012] GAM1510 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21013] An enzyme complex designated DICER COMPLEX, dices the GAM1510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1510 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM1510 RNA is designated SEQ ID:4092, and is provided hereinbelow with reference to the sequence listing part.

[21014] GAM1510 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1510 target RNA, herein designated GAM TARGET RNA. GAM1510 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21015] GAM1510 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1510 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1510 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1510 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1510 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21016] The complementary binding of GAM1510 RNA, herein designated GAM RNA, to target binding sites on GAM1510 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1510 target RNA, herein designated GAM TARGET RNA, into GAM1510 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21017] It is appreciated that GAM1510 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1510 target genes. The mRNA of each one of this plurality of GAM1510 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1510 RNA, herein designated GAM RNA, and which when bound by GAM1510 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1510 target proteins.

[21018] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1510 gene, herein designated GAM GENE, on one or more GAM1510 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21019] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1510 correlate with, and may be deduced from, the identity of the target genes which GAM1510 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21020] Nucleotide sequences of the GAM1510 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1510 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1510 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1510 are further described hereinbelow with reference to Table 1.

[21021] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1510 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21022] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1511 (GAM1511) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21023] GAM1511 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1511 was detected is described hereinabove with reference to Figs. 2-8.

[21024] GAM1511 gene, herein designated GAM GENE, and GAM1511 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21025] GAM1511 gene, herein designated GAM GENE, encodes a GAM1511 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1511 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1511 precursor RNA is designated SEQ ID:1488, and is provided hereinbelow with reference to the sequence listing part.

[21026] GAM1511 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21027] An enzyme complex designated DICER COMPLEX, dices the GAM1511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1511 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1511 RNA is designated SEQ ID:4093, and is provided hereinbelow with reference to the sequence listing part.

[21028] GAM1511 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1511 target RNA, herein designated GAM TARGET RNA. GAM1511 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21029] GAM1511 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1511 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1511 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1511 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1511 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21030] The complementary binding of GAM1511 RNA, herein designated GAM RNA, to target binding sites on GAM1511 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1511 target RNA, herein designated GAM TARGET RNA, into GAM1511 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21031] It is appreciated that GAM1511 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1511 target genes. The

mRNA of each one of this plurality of GAM1511 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1511 RNA, herein designated GAM RNA, and which when bound by GAM1511 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1511 target proteins.

[21032] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1511 gene, herein designated GAM GENE, on one or more GAM1511 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21033] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1511 correlate with, and may be deduced from, the identity of the target genes which GAM1511 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21034] Nucleotide sequences of the GAM1511 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1511 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1511 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1511 are further described hereinbelow with reference to Table 1.

[21035] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1511 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21036] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1512 (GAM1512) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21037] GAM1512 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1512 was detected is described hereinabove with reference to Figs. 2-8.

[21038] GAM1512 gene, herein designated GAM GENE, and GAM1512 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21039] GAM1512 gene, herein designated GAM GENE, encodes a GAM1512 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1512 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1512 precursor RNA is designated SEQ ID:1489, and is provided hereinbelow with reference to the sequence listing part.

[21040] GAM1512 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21041] An enzyme complex designated DICER COMPLEX, dices the GAM1512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1512 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1512 RNA is designated SEQ ID:4094, and is provided hereinbelow with reference to the sequence listing part.

[21042] GAM1512 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1512 target RNA, herein designated GAM TARGET RNA. GAM1512 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21043] GAM1512 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1512 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1512 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1512 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1512 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21044] The complementary binding of GAM1512 RNA, herein designated GAM RNA, to target binding sites on GAM1512 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1512 target RNA, herein designated GAM TARGET RNA, into GAM1512 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21045] It is appreciated that GAM1512 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1512 target genes. The mRNA of each one of this plurality of GAM1512 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1512 RNA, herein designated GAM RNA, and which when bound by GAM1512 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1512 target proteins.

[21046] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1512 gene, herein designated GAM GENE, on one or more GAM1512 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21047] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1512 correlate with, and may be deduced from, the identity of the target

genes which GAM1512 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21048] Nucleotide sequences of the GAM1512 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1512 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1512 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1512 are further described hereinbelow with reference to Table 1.

[21049] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1512 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21050] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1513 (GAM1513) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21051] GAM1513 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1513 was detected is described hereinabove with reference to Figs. 2-8.

[21052] GAM1513 gene, herein designated GAM GENE, and GAM1513 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21053] GAM1513 gene, herein designated GAM GENE, encodes a GAM1513 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1513 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1513 precursor RNA is designated SEQ ID:1490, and is provided hereinbelow with reference to the sequence listing part.

[21054] GAM1513 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21055] An enzyme complex designated DICER COMPLEX, dices the GAM1513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1513 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1513 RNA is designated SEQ ID:4095, and is provided

hereinbelow with reference to the sequence listing part.

[21056] GAM1513 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1513 target RNA, herein designated GAM TARGET RNA. GAM1513 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21057] GAM1513 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1513 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1513 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1513 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1513 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21058] The complementary binding of GAM1513 RNA, herein designated GAM RNA, to target binding sites on GAM1513 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1513 target RNA, herein designated GAM TARGET RNA, into GAM1513 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21059] It is appreciated that GAM1513 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1513 target genes. The mRNA of each one of this plurality of GAM1513 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1513 RNA, herein designated GAM RNA, and which when bound by GAM1513 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1513 target proteins.

[21060] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1513 gene, herein designated GAM GENE, on one or more GAM1513 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21061] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1513 correlate with, and may be deduced from, the identity of the target genes which GAM1513 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21062] Nucleotide sequences of the GAM1513 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1513 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1513 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1513 are further described hereinbelow with reference to Table 1.

[21063] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1513 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21064] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1514 (GAM1514) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21065] GAM1514 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1514 was detected is described hereinabove with reference to Figs. 2-8.

[21066] GAM1514 gene, herein designated GAM GENE, and GAM1514 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21067] GAM1514 gene, herein designated GAM GENE, encodes a GAM1514 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1514 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1514 precursor RNA is designated SEQ ID:1491, and is provided hereinbelow with reference to the sequence listing part.

[21068] GAM1514 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21069] An enzyme complex designated DICER COMPLEX, dices the GAM1514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1514 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1514 RNA is designated SEQ ID:4096, and is provided hereinbelow with reference to the sequence listing part.

[21070] GAM1514 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1514 target RNA, herein designated GAM TARGET RNA. GAM1514 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21071] GAM1514 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1514 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1514 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1514 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1514 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21072] The complementary binding of GAM1514 RNA, herein designated GAM RNA, to target binding sites on GAM1514 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1514 target RNA, herein designated GAM TARGET RNA, into GAM1514 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21073] It is appreciated that GAM1514 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1514 target genes. The mRNA of each one of this plurality of GAM1514 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1514 RNA, herein designated GAM RNA, and which when bound by GAM1514 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1514 target proteins.

[21074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1514 gene, herein designated GAM GENE, on one or more GAM1514 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21075] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1514 correlate with, and may be deduced from, the identity of the target genes which GAM1514 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21076] Nucleotide sequences of the GAM1514 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1514 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1514 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1514 are further described hereinbelow with reference to Table 1.

[21077] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1514 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21078] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1515 (GAM1515) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21079] GAM1515 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1515 was detected is described hereinabove with reference to Figs. 2-8.

[21080] GAM1515 gene, herein designated GAM GENE, and GAM1515 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21081] GAM1515 gene, herein designated GAM GENE, encodes a GAM1515 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1515 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1515 precursor RNA is designated SEQ ID:1492, and is provided hereinbelow with reference to the sequence listing part.

[21082] GAM1515 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21083] An enzyme complex designated DICER COMPLEX, dices the GAM1515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1515 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1515 RNA is designated SEQ ID:4097, and is provided hereinbelow with reference to the sequence listing part.

[21084] GAM1515 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1515 target RNA, herein designated GAM TARGET RNA. GAM1515 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21085] GAM1515 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1515 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1515 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1515 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1515 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21086] The complementary binding of GAM1515 RNA, herein designated GAM RNA, to target binding sites on GAM1515 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1515 target RNA, herein designated GAM TARGET RNA, into GAM1515 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21087] It is appreciated that GAM1515 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1515 target genes. The mRNA of each one of this plurality of GAM1515 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1515 RNA, herein designated GAM RNA, and which when bound by GAM1515 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1515 target proteins.

[21088] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1515 gene, herein designated GAM GENE, on one or more GAM1515 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21089] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1515 correlate with, and may be deduced from, the identity of the target genes which GAM1515 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21090] Nucleotide sequences of the GAM1515 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1515 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1515 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1515 are further described hereinbelow with reference to Table 1.

[21091] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1515 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21092] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1516 (GAM1516) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21093] GAM1516 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1516 was detected is described hereinabove with reference to Figs. 2-8.

[21094] GAM1516 gene, herein designated GAM GENE, and GAM1516 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21095] GAM1516 gene, herein designated GAM GENE, encodes a GAM1516 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1516 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1516 precursor RNA is designated SEQ ID:1493, and is provided hereinbelow with reference to the sequence listing part.

[21096] GAM1516 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21097] An enzyme complex designated DICER COMPLEX, dices the GAM1516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1516 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1516 RNA is designated SEQ ID:4098, and is provided hereinbelow with reference to the sequence listing part.

[21098] GAM1516 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1516 target RNA, herein designated GAM TARGET RNA. GAM1516 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21099] GAM1516 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1516 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1516 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1516 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1516 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21100] The complementary binding of GAM1516 RNA, herein designated GAM RNA, to target binding sites on GAM1516 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1516 target RNA, herein designated GAM TARGET RNA, into GAM1516 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21101] It is appreciated that GAM1516 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1516 target genes. The mRNA of each one of this plurality of GAM1516 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1516 RNA, herein designated GAM RNA, and which when bound by GAM1516 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1516 target proteins.

[21102] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1516 gene, herein designated GAM GENE, on one or more GAM1516 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21103] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1516 correlate with, and may be deduced from, the identity of the target genes which GAM1516 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21104] Nucleotide sequences of the GAM1516 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1516 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1516 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1516 are further described hereinbelow with reference to Table 1.

[21105] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1516 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21106] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1517 (GAM1517) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21107] GAM1517 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1517 was detected is described hereinabove with reference to Figs. 2-8.

[21108] GAM1517 gene, herein designated GAM GENE, and GAM1517 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21109] GAM1517 gene, herein designated GAM GENE, encodes a GAM1517 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1517 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1517 precursor RNA is designated SEQ ID:1494, and is provided hereinbelow with reference to the sequence listing part.

[21110] GAM1517 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21111] An enzyme complex designated DICER COMPLEX, dices the GAM1517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1517 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM1517 RNA is designated SEQ ID:4099, and is provided hereinbelow with reference to the sequence listing part.

[21112] GAM1517 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1517 target RNA, herein designated GAM TARGET RNA. GAM1517 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21113] GAM1517 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1517 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1517 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1517 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1517 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21114] The complementary binding of GAM1517 RNA, herein designated GAM RNA, to target binding sites on GAM1517 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1517 target RNA, herein designated GAM TARGET RNA, into GAM1517 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21115] It is appreciated that GAM1517 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1517 target genes. The

mRNA of each one of this plurality of GAM1517 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1517 RNA, herein designated GAM RNA, and which when bound by GAM1517 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1517 target proteins.

[21116] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1517 gene, herein designated GAM GENE, on one or more GAM1517 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21117] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1517 correlate with, and may be deduced from, the identity of the target genes which GAM1517 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21118] Nucleotide sequences of the GAM1517 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1517 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1517 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1517 are further described hereinbelow with reference to Table 1.

[21119] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1517 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21120] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1518 (GAM1518) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21121] GAM1518 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1518 was detected is described hereinabove with reference to Figs. 2-8.

[21122] GAM1518 gene, herein designated GAM GENE, and GAM1518 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21123] GAM1518 gene, herein designated GAM GENE, encodes a GAM1518 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1518 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1518 precursor RNA is designated SEQ ID:1495, and is provided hereinbelow with reference to the sequence listing part.

[21124] GAM1518 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21125] An enzyme complex designated DICER COMPLEX, dices the GAM1518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1518 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1518 RNA is designated SEQ ID:4100, and is provided hereinbelow with reference to the sequence listing part.

[21126] GAM1518 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1518 target RNA, herein designated GAM TARGET RNA. GAM1518 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21127] GAM1518 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1518 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1518 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1518 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1518 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21128] The complementary binding of GAM1518 RNA, herein designated GAM RNA, to target binding sites on GAM1518 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1518 target RNA, herein designated GAM TARGET RNA, into GAM1518 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21129] It is appreciated that GAM1518 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1518 target genes. The mRNA of each one of this plurality of GAM1518 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1518 RNA, herein designated GAM RNA, and which when bound by GAM1518 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1518 target proteins.

[21130] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1518 gene, herein designated GAM GENE, on one or more GAM1518 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21131] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1518 correlate with, and may be deduced from, the identity of the target

genes which GAM1518 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21132] Nucleotide sequences of the GAM1518 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1518 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1518 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1518 are further described hereinbelow with reference to Table 1.

[21133] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1518 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21134] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1519 (GAM1519) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21135] GAM1519 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1519 was detected is described hereinabove with reference to Figs. 2-8.

[21136] GAM1519 gene, herein designated GAM GENE, and GAM1519 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21137] GAM1519 gene, herein designated GAM GENE, encodes a GAM1519 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1519 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1519 precursor RNA is designated SEQ ID:1496, and is provided hereinbelow with reference to the sequence listing part.

[21138] GAM1519 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21139] An enzyme complex designated DICER COMPLEX, dices the GAM1519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1519 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1519 RNA is designated SEQ ID:4101, and is provided

hereinbelow with reference to the sequence listing part.

[21140] GAM1519 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1519 target RNA, herein designated GAM TARGET RNA. GAM1519 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21141] GAM1519 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1519 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1519 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1519 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1519 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21142] The complementary binding of GAM1519 RNA, herein designated GAM RNA, to target binding sites on GAM1519 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1519 target RNA, herein designated GAM TARGET RNA, into GAM1519 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21143] It is appreciated that GAM1519 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1519 target genes. The mRNA of each one of this plurality of GAM1519 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1519 RNA, herein designated GAM RNA, and which when bound by GAM1519 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1519 target proteins.

[21144] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1519 gene, herein designated GAM GENE, on one or more GAM1519 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21145] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1519 correlate with, and may be deduced from, the identity of the target genes which GAM1519 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21146] Nucleotide sequences of the GAM1519 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1519 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1519 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1519 are further described hereinbelow with reference to Table 1.

[21147] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1519 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21148] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1520 (GAM1520) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21149] GAM1520 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1520 was detected is described hereinabove with reference to Figs. 2-8.

[21150] GAM1520 gene, herein designated GAM GENE, and GAM1520 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21151] GAM1520 gene, herein designated GAM GENE, encodes a GAM1520 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1520 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1520 precursor RNA is designated SEQ ID:1497, and is provided hereinbelow with reference to the sequence listing part.

[21152] GAM1520 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21153] An enzyme complex designated DICER COMPLEX, dices the GAM1520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1520 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM1520 RNA is designated SEQ ID:4102, and is provided hereinbelow with reference to the sequence listing part.

[21154] GAM1520 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1520 target RNA, herein designated GAM TARGET RNA. GAM1520 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21155] GAM1520 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1520 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1520 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1520 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1520 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21156] The complementary binding of GAM1520 RNA, herein designated GAM RNA, to target binding sites on GAM1520 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1520 target RNA, herein designated GAM TARGET RNA, into GAM1520 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21157] It is appreciated that GAM1520 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1520 target genes. The mRNA of each one of this plurality of GAM1520 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1520 RNA, herein designated GAM RNA, and which when bound by GAM1520 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1520 target proteins.

[21158] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1520 gene, herein designated GAM GENE, on one or more GAM1520 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21159] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1520 correlate with, and may be deduced from, the identity of the target genes which GAM1520 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21160] Nucleotide sequences of the GAM1520 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1520 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1520 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1520 are further described hereinbelow with reference to Table 1.

[21161] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1520 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21162] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1521 (GAM1521) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21163] GAM1521 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1521 was detected is described hereinabove with reference to Figs. 2-8.

[21164] GAM1521 gene, herein designated GAM GENE, and GAM1521 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21165] GAM1521 gene, herein designated GAM GENE, encodes a GAM1521 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1521 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1521 precursor RNA is designated SEQ ID:1498, and is provided hereinbelow with reference to the sequence listing part.

[21166] GAM1521 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21167] An enzyme complex designated DICER COMPLEX, dices the GAM1521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1521 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1521 RNA is designated SEQ ID:4103, and is provided hereinbelow with reference to the sequence listing part.

[21168] GAM1521 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1521 target RNA, herein designated GAM TARGET RNA. GAM1521 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21169] GAM1521 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1521 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1521 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1521 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1521 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21170] The complementary binding of GAM1521 RNA, herein designated GAM RNA, to target binding sites on GAM1521 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1521 target RNA, herein designated GAM TARGET RNA, into GAM1521 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21171] It is appreciated that GAM1521 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1521 target genes. The mRNA of each one of this plurality of GAM1521 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1521 RNA, herein designated GAM RNA, and which when bound by GAM1521 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1521 target proteins.

[21172] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1521 gene, herein designated GAM GENE, on one or more GAM1521 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21173] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1521 correlate with, and may be deduced from, the identity of the target genes which GAM1521 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21174] Nucleotide sequences of the GAM1521 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1521 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1521 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1521 are further described hereinbelow with reference to Table 1.

[21175] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1521 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21176] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1522 (GAM1522) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21177] GAM1522 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1522 was detected is described hereinabove with reference to Figs. 2-8.

[21178] GAM1522 gene, herein designated GAM GENE, and GAM1522 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21179] GAM1522 gene, herein designated GAM GENE, encodes a GAM1522 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1522 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1522 precursor RNA is designated SEQ ID:1499, and is provided hereinbelow with reference to the sequence listing part.

[21180] GAM1522 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21181] An enzyme complex designated DICER COMPLEX, dices the GAM1522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1522 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM1522 RNA is designated SEQ ID:4104, and is provided hereinbelow with reference to the sequence listing part.

[21182] GAM1522 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1522 target RNA, herein designated GAM TARGET RNA. GAM1522 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21183] GAM1522 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1522 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1522 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1522 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1522 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21184] The complementary binding of GAM1522 RNA, herein designated GAM RNA, to target binding sites on GAM1522 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1522 target RNA, herein designated GAM TARGET RNA, into GAM1522 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21185] It is appreciated that GAM1522 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1522 target genes. The mRNA of each one of this plurality of GAM1522 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1522 RNA, herein designated GAM RNA, and which when bound by GAM1522 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1522 target proteins.

[21186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1522 gene, herein designated GAM GENE, on one or more GAM1522 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21187] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1522 correlate with, and may be deduced from, the identity of the target genes which GAM1522 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21188] Nucleotide sequences of the GAM1522 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1522 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1522 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1522 are further described hereinbelow with reference to Table 1.

[21189] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1522 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21190] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1523 (GAM1523) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21191] GAM1523 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1523 was detected is described hereinabove with reference to Figs. 2-8.

[21192] GAM1523 gene, herein designated GAM GENE, and GAM1523 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21193] GAM1523 gene, herein designated GAM GENE, encodes a GAM1523 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1523 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1523 precursor RNA is designated SEQ ID:1500, and is provided hereinbelow with reference to the sequence listing part.

[21194] GAM1523 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21195] An enzyme complex designated DICER COMPLEX, dices the GAM1523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1523 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1523 RNA is designated SEQ ID:4106, and is provided hereinbelow with reference to the sequence listing part.

[21196] GAM1523 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1523 target RNA, herein designated GAM TARGET RNA. GAM1523 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21197] GAM1523 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1523 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1523 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1523 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1523 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21198] The complementary binding of GAM1523 RNA, herein designated GAM RNA, to target binding sites on GAM1523 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1523 target RNA, herein designated GAM TARGET RNA, into GAM1523 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21199] It is appreciated that GAM1523 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1523 target genes. The

mRNA of each one of this plurality of GAM1523 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1523 RNA, herein designated GAM RNA, and which when bound by GAM1523 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1523 target proteins.

[21200] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1523 gene, herein designated GAM GENE, on one or more GAM1523 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21201] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1523 correlate with, and may be deduced from, the identity of the target genes which GAM1523 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21202] Nucleotide sequences of the GAM1523 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1523 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1523 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1523 are further described hereinbelow with reference to Table 1.

[21203] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1523 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21204] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1524 (GAM1524) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21205] GAM1524 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1524 was detected is described hereinabove with reference to Figs. 2-8.

[21206] GAM1524 gene, herein designated GAM GENE, and GAM1524 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21207] GAM1524 gene, herein designated GAM GENE, encodes a GAM1524 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1524 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1524 precursor RNA is designated SEQ ID:1501, and is provided hereinbelow with reference to the sequence listing part.

[21208] GAM1524 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21209] An enzyme complex designated DICER COMPLEX, dices the GAM1524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1524 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM1524 RNA is designated SEQ ID:4105, and is provided hereinbelow with reference to the sequence listing part.

[21210] GAM1524 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1524 target RNA, herein designated GAM TARGET RNA. GAM1524 target RNA, herein designated GAM

TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21211] GAM1524 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1524 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1524 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1524 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1524 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21212] The complementary binding of GAM1524 RNA, herein designated GAM RNA, to target binding sites on GAM1524 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1524 target RNA, herein designated GAM TARGET RNA, into GAM1524 target protein, herein

designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21213] It is appreciated that GAM1524 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1524 target genes. The mRNA of each one of this plurality of GAM1524 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1524 RNA, herein designated GAM RNA, and which when bound by GAM1524 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1524 target proteins.

[21214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1524 gene, herein designated GAM GENE, on one or more GAM1524 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21215] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1524 correlate with, and may be deduced from, the identity of the target

genes which GAM1524 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21216] Nucleotide sequences of the GAM1524 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1524 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1524 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1524 are further described hereinbelow with reference to Table 1.

[21217] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1524 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21218] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1525 (GAM1525) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21219] GAM1525 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1525 was detected is described hereinabove with reference to Figs. 2-8.

[21220] GAM1525 gene, herein designated GAM GENE, and GAM1525 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[21221] GAM1525 gene, herein designated GAM GENE, encodes a GAM1525 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1525 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1525 precursor RNA is designated SEQ ID:1502, and is provided hereinbelow with reference to the sequence listing part.

[21222] GAM1525 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21223] An enzyme complex designated DICER COMPLEX, dices the GAM1525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1525 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM1525 RNA is designated SEQ ID:4107, and is provided

hereinbelow with reference to the sequence listing part.

[21224] GAM1525 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1525 target RNA, herein designated GAM TARGET RNA. GAM1525 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21225] GAM1525 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1525 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1525 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1525 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1525 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21226] The complementary binding of GAM1525 RNA, herein designated GAM RNA, to target binding sites on GAM1525 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1525 target RNA, herein designated GAM TARGET RNA, into GAM1525 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21227] It is appreciated that GAM1525 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1525 target genes. The mRNA of each one of this plurality of GAM1525 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1525 RNA, herein designated GAM RNA, and which when bound by GAM1525 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1525 target proteins.

[21228] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1525 gene, herein designated GAM GENE, on one or more GAM1525 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding

sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21229] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1525 correlate with, and may be deduced from, the identity of the target genes which GAM1525 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21230] Nucleotide sequences of the GAM1525 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1525 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1525 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1525 are further described hereinbelow with reference to Table 1.

[21231] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1525 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21232] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1526 (GAM1526) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21233] GAM1526 is a novel bioinformatically detected regulatory, non protein

coding, micro RNA (miRNA) gene. The method by which GAM1526 was detected is described hereinabove with reference to Figs. 2-8.

[21234] GAM1526 gene, herein designated GAM GENE, and GAM1526 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21235] GAM1526 gene, herein designated GAM GENE, encodes a GAM1526 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1526 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1526 precursor RNA is designated SEQ ID:1503, and is provided hereinbelow with reference to the sequence listing part.

[21236] GAM1526 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21237] An enzyme complex designated DICER COMPLEX, dices the GAM1526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1526 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin

structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1526 RNA is designated SEQ ID:4108, and is provided hereinbelow with reference to the sequence listing part.

[21238] GAM1526 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1526 target RNA, herein designated GAM TARGET RNA. GAM1526 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21239] GAM1526 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1526 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1526 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1526 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1526 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target

binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21240] The complementary binding of GAM1526 RNA, herein designated GAM RNA, to target binding sites on GAM1526 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1526 target RNA, herein designated GAM TARGET RNA, into GAM1526 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21241] It is appreciated that GAM1526 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1526 target genes. The mRNA of each one of this plurality of GAM1526 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1526 RNA, herein designated GAM RNA, and which when bound by GAM1526 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1526 target proteins.

[21242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1526 gene, herein designated GAM GENE, on one or more GAM1526 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21243] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1526 correlate with, and may be deduced from, the identity of the target genes which GAM1526 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21244] Nucleotide sequences of the GAM1526 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1526 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1526 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1526 are further described hereinbelow with reference to Table 1.

[21245] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1526 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21246] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1527 (GAM1527) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21247] GAM1527 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1527 was detected is described hereinabove with reference to Figs. 2-8.

[21248] GAM1527 gene, herein designated GAM GENE, and GAM1527 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21249] GAM1527 gene, herein designated GAM GENE, encodes a GAM1527 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1527 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1527 precursor RNA is designated SEQ ID:1504, and is provided hereinbelow with reference to the sequence listing part.

[21250] GAM1527 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21251] An enzyme complex designated DICER COMPLEX, dices the GAM1527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1527 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM1527 RNA is designated SEQ ID:4109, and is provided hereinbelow with reference to the sequence listing part.

[21252] GAM1527 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1527 target RNA, herein designated GAM TARGET RNA. GAM1527 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21253] GAM1527 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1527 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1527 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM1527 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1527 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21254] The complementary binding of GAM1527 RNA, herein designated GAM RNA, to target binding sites on GAM1527 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1527 target RNA, herein designated GAM TARGET RNA, into GAM1527 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21255] It is appreciated that GAM1527 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1527 target genes. The mRNA of each one of this plurality of GAM1527 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1527 RNA, herein designated GAM RNA, and which when bound by GAM1527 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1527 target proteins.

[21256] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition

exerted by GAM1527 gene, herein designated GAM GENE, on one or more GAM1527 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21257] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1527 correlate with, and may be deduced from, the identity of the target genes which GAM1527 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21258] Nucleotide sequences of the GAM1527 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1527 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1527 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1527 are further described hereinbelow with reference to Table 1.

[21259] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1527 RNA, herein designated GAM RNA, are described hereinbelow

with reference to Table 2.

[21260] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1528 (GAM1528) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21261] GAM1528 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1528 was detected is described hereinabove with reference to Figs. 2-8.

[21262] GAM1528 gene, herein designated GAM GENE, and GAM1528 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21263] GAM1528 gene, herein designated GAM GENE, encodes a GAM1528 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1528 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1528 precursor RNA is designated SEQ ID:1505, and is provided hereinbelow with reference to the sequence listing part.

[21264] GAM1528 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA

encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21265] An enzyme complex designated DICER COMPLEX, dices the GAM1528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1528 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM1528 RNA is designated SEQ ID:4110, and is provided hereinbelow with reference to the sequence listing part.

[21266] GAM1528 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1528 target RNA, herein designated GAM TARGET RNA. GAM1528 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21267] GAM1528 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1528 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1528 RNA,

herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1528 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1528 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21268] The complementary binding of GAM1528 RNA, herein designated GAM RNA, to target binding sites on GAM1528 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1528 target RNA, herein designated GAM TARGET RNA, into GAM1528 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21269] It is appreciated that GAM1528 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1528 target genes. The mRNA of each one of this plurality of GAM1528 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1528 RNA, herein designated GAM RNA, and which when bound by GAM1528 RNA, herein designated GAM RNA,

causes inhibition of translation of respective one or more GAM1528 target proteins.

[21270] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1528 gene, herein designated GAM GENE, on one or more GAM1528 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21271] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1528 correlate with, and may be deduced from, the identity of the target genes which GAM1528 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21272] Nucleotide sequences of the GAM1528 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1528 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM1528 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1528 are further described hereinbelow with reference to Table 1.

[21273] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1528 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21274] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1529 (GAM1529) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21275] GAM1529 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1529 was detected is described hereinabove with reference to Figs. 2-8.

[21276] GAM1529 gene, herein designated GAM GENE, and GAM1529 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21277] GAM1529 gene, herein designated GAM GENE, encodes a GAM1529 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1529 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1529 precursor RNA is designated SEQ ID:1506, and is provided hereinbelow with reference to the sequence listing part.

[21278] GAM1529 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21279] An enzyme complex designated DICER COMPLEX, dices the GAM1529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM1529 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM1529 RNA is designated SEQ ID:4111, and is provided hereinbelow with reference to the sequence listing part.

[21280] GAM1529 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM1529 target RNA, herein designated GAM TARGET RNA. GAM1529 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[21281] GAM1529 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM1529 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM1529 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM1529 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM1529 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[21282] The complementary binding of GAM1529 RNA, herein designated GAM RNA, to target binding sites on GAM1529 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM1529 target RNA, herein designated GAM TARGET RNA, into GAM1529 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[21283] It is appreciated that GAM1529 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM1529 target genes. The

mRNA of each one of this plurality of GAM1529 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM1529 RNA, herein designated GAM RNA, and which when bound by GAM1529 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM1529 target proteins.

[21284] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM1529 gene, herein designated GAM GENE, on one or more GAM1529 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[21285] It is yet further appreciated that specific functions, and accordingly utilities, of GAM1529 correlate with, and may be deduced from, the identity of the target genes which GAM1529 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21286] Nucleotide sequences of the GAM1529 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM1529 RNA, herein

designated GAM RNA, and a schematic representation of the secondary folding of GAM1529 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM1529 are further described hereinbelow with reference to Table 1.

[21287] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM1529 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[21288] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 1530 (GAM1530) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[21289] GAM1530 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM1530 was detected is described hereinabove with reference to Figs. 2-8.

[21290] GAM1530 gene, herein designated GAM GENE, and GAM1530 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[21291] GAM1530 gene, herein designated GAM GENE, encodes a GAM1530 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM1530 precursor RNA,

herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM1530 precursor RNA is designated SEQ ID:1507, and is provided hereinbelow with reference to the sequence listing part.

[21292] GAM1530 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM1530 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
